

Supplemental Table 1. Genomic evidence for extracellular deamination by free-living soil diazotrophs. SignalP scores are values between 0 and 1 that indicate the likeliness of the presence of a signal peptide in an amino acid sequence. Signal P scores greater than 0.42 were used to indicate the presence of a signal peptide in gram-positive bacteria. We found no genomic evidence for extracellular deamination by *Clostridium acetobutylicum* (ATCC 9039) or *Clostridium pasteurianum* (ATCC 6013), which are therefore not listed in this table.
