

Minocycline promotes the generation of dendritic cells with regulatory properties

Supplementary Material

Supplementary Figure S1. Mino-DCs isolated from the spleens of mice treated with GM-CSF plus minocycline express significantly lower levels of I-A^b and CD80 compared to Ctrl-DCs isolated from the spleens of mice treated with GM-CSF alone. (A) Ctrl-DCs, shaded area; Mino-DCs, black line; isotype-matched control, grey line. (B) Mean fluorescence intensities of DCs. The data are presented as the mean \pm SD of three independent experiments; *P < 0.05 compared with control.
