

PDGFR α depletion attenuates glioblastoma stem cells features by modulation of STAT3, RB1 and multiple oncogenic signals

SUPPLEMENTARY FIGURE

Supplementary Figure S1: PKC α is not involved in the regulation of stemness in p-CSC2. Reduction of PKC α protein expression in shPKC α cell clones does not affect expression of multipotency stem cell markers Nestin and Sox2 compared to pLKO.1 cell, after 3 days of PDGF-AA treatment.
