Supplementary Fig. S1: Percentage of drugs per drug class among drug libraries used in the HTS. Three libraries of FDA-approved drugs were used in this screen (MS Discovery US Drug Collection, NCI Approved Oncology Drug Set II and the NCI Combo Set).

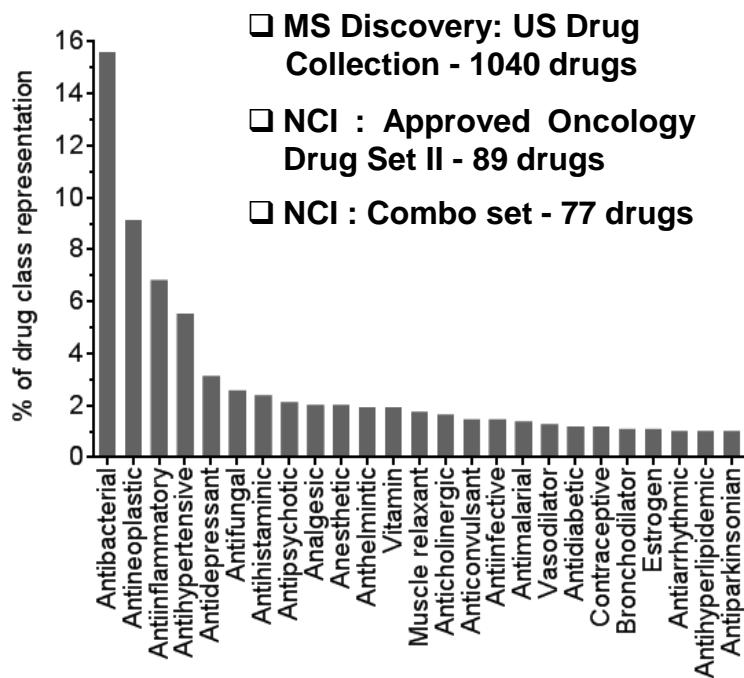

Supplementary Fig. S2: Synergistic GFP reactivation in YB5 cells by HDACi TSA and positive hits identified in the HTS. A, Average values of all positive controls, included in each 96 well-plates (in quadruplicates), during HTS, with HDACi TSA (24h, 0.2 μ M) and decitabine (DAC, 72h, 50 nM) and their sequential combination. Statistical analysis was done by One-way ANOVA followed by the Tukey–Kramer Multiple Comparison Test ($P < 0.0001$). B, Validation experiment with digitoxin (24h treatment) in sequential combination after decitabine (72h treatment) and the doses indicated on the graph. GFP expression was measured immediately after digitoxin treatments by flow cytometry (n=3). C, Validation experiments with positive hits identified in the HTS in combination with decitabine (sequential and simultaneous) or with TSA (sequential).

Supplementary Fig. S3. Optimization of the treatment schedule of the decitabine and proscillarin A combination. Time of exposure was modified to identify which schedule would induce the most potent GFP reactivation. Simultaneous combination of 24, 48, and 72h were compared with sequential combination with decitabine (48h, 100 nM) followed by proscillarin A (24h and 48h at 50 nM).

Supplementary Fig. S4. Transcriptome analysis using Metascape. A, Results of Metascape analysis in genes exclusively up-regulated with proscillarin A treatment. B, Results of Metascape analysis in genes exclusively up-regulated by the combination treatment.
