

Figure S4. PCR amplification results of the primers tested for differentiating *C. gloeosporioides* s.l. from *C. actutatum* s.l.. ITS1/4 was used as a positive control. P₁/P₂ showed the best specificity and consistency among all tested ones. In P₁/P₂ result, the smaller amplicon sizes of XY15, 1104-7 and LQ33 were due to a smaller cob-1 intron size (Figure S4a). NTC, no template control.
