

MALDI imaging reveals NCOA7 as a potential biomarker in oral squamous cell carcinoma arising from oral submucous fibrosis

SUPPLEMENTARY FIGURE

Supplementary Figure S1: **A.** HSC-4 cells were treated with siNC or siNCOA7, and expression of NCOA7 was examined by western blot. **B.** HSC-4 cells were treated with siNC or siNCOA7, and proliferation HSC-4 cells were examined by BrdU labeling assay. **C.** HSC-4 cells were treated with siNC or siNCOA7, and proliferation HSC-4 cells were examined by colony formation assay. All data were representative of at least three independent experiments. **, $P < 0.01$.
