

## Supplementary Materials

Cervical cancer cell line secretome highlights the roles of transforming growth factor-beta-induced protein ig-h3, peroxiredoxin-2 and NRF2 on cervical carcinogenesis.

### Table Legends

**S1 Table.** Transition list of endogenous and heavy peptide as exported from skyline and imported in the acquisition method.

The mass (m/z) in the first (Q1) and third quadrupole (Q3), the dwell time and the peptide sequence, as well as the charge state and the collision energy of the corresponding fragments are shown.

**S2 Table.** MRM quantification data. Light to heavy ratio of the peptide peak areas used for NRF2 protein quantification in each biological replicate.

**S3 Table.** Differentially expressed proteins in secretome analysis of SiHa vs HCK1T. Forty-five differentially expressed spots corresponding to 40 proteins in SiHa vs HCK1T comparison. The Mann-Whitney test was used for the statistical analysis. A  $p$  value  $<0.05$  (95% confidence levels) was considered statistically significant.

**S4 Table.** Differentially expressed proteins in secretome analysis of HeLa vs HCK1T. Forty-three differentially expressed spots corresponding to 44 proteins in HeLa vs HCK1T comparison. The Mann-Whitney test was used for the statistical analysis. A *p* value <0.05 (95% confidence levels) was considered statistically significant.

**S5 Table.** Differentially expressed proteins in secretome analysis of C33A vs HCK1T. Fifty-three differentially expressed spots corresponding to 41 proteins in C33A vs HCK1T comparison. The Mann-Whitney test was used for the statistical analysis. A *p* value <0.05 (95% confidence levels) was considered statistically significant.

**S6 Table.** Comparison of differentially expressed proteins in secretome analysis between individual comparisons in each cancer cell line vs HCK1T. Sixteen proteins are common in all comparisons.

**S7 Table.** Molecular function of differentially expressed proteins in secretome analysis. Predicted molecular function of differentially expressed proteins in all cancer cell lines vs HCK1T, by Panther Classification System (<http://www.pantherdb.org/>).

**S8 Table.** Differentially expressed proteins used in IPA. Sixty-seven differentially expressed proteins were used in IPA analysis after they were converted to gene names. Data were submitted to IPA as fold change values (ratios) calculated against the control group (HCK1T). The mean ratio was taken from all identified spots and only proteins with fold change  $>\pm 2$  were taken into account.

**S9 Table.** IPA results for transcription factors in cancer vs HCK1T secretome. IPA results showing the main transcription factors involved in regulation of the differentially expressed proteins in cancer vs normal.

**S10 Table.** Additional number of transcription factors that regulate NRF2 targets. The number of transcription regulators of NRF2 targets are listed.

## Figure Legends

**S1 Fig.** Molecular function analysis of differentially expressed proteins identified in the secretome of cancer cell lines compared to HCK1T, as predicted by Panther Classification System (<http://www.pantherdb.org/>). Sixty-seven proteins were found to be differentially expressed in all three cancer cell lines vs HCK1T, and were classified according to their molecular function. The majority of proteins displayed catalytic activity (41.6%), while 32.4% displayed binding activity and 11.1% structural molecule activity.

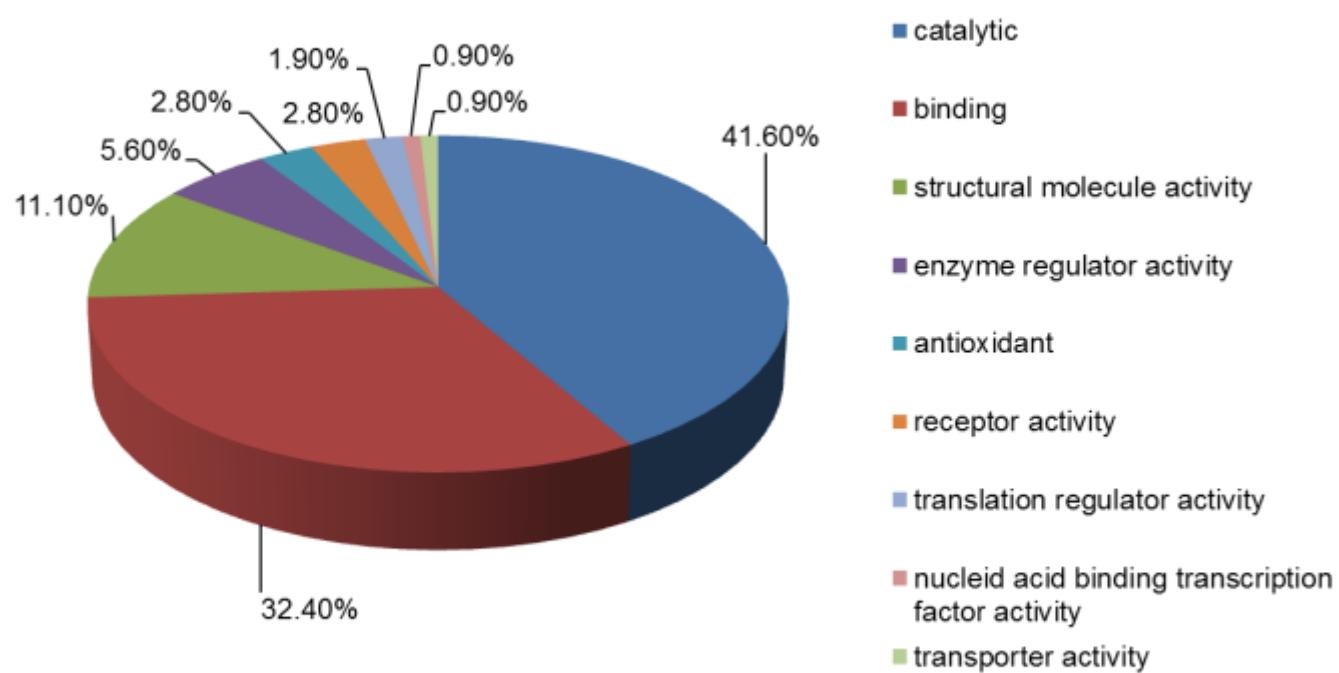

**S2 Fig.** Molecular function analysis of differentially expressed proteins identified in the secretome of each cancer cell line compared to HCK1T, as predicted by Panther Classification System (<http://www.pantherdb.org/>). (A) SiHa vs HCK1T, (B) HeLa vs HCK1T and (C) C33A vs HCK1T. The proteins were classified according to their molecular function. The majority of proteins display catalytic and binding activity, followed by structural molecule activity.

**S3 Fig.** Representative SDS PAGE gel confirming the equal loading of the secretome samples used for Western blot analysis. Ten µg of secretome of each cell line was loaded and analyzed in precast gradient (4-12%) gels.

**S4 Fig.** Western blot analysis for tubulin in cell lysates and their corresponding secretomes, providing proof that peroxiredoxin-2 is genuinely secreted and is not a product of cell lysis. Cells were incubated with SFM (Serum-Free Medium) for 24 h after which CM (conditioned medium) was collected. The intensity of tubulin (a marker of intracellular protein contamination of secretome due to extensive cell lysis) in secretome samples deriving from cells incubated with SFM is negligible compared to the corresponding total cell extracts. Representative images of two biological replicates are presented.

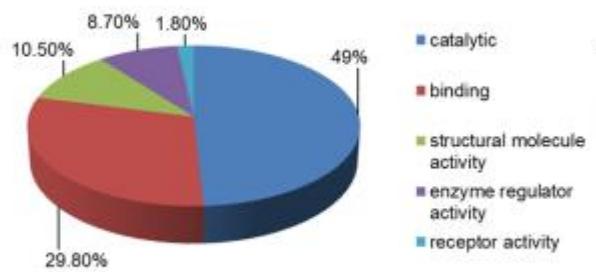

**S5 Fig.** Validation of proteomics and bioinformatics results by Western blot analysis. Western blot analysis for NRF2 target indicated in Fig.4A (HSP90AB1) was performed in C33A vs HCK1T, where the upregulation level of NRF2 was higher. Panels A and B represent Western blots for HSP90AB1 in total cell extract and secretome respectively. Representative images of two biological replicates are shown for each cell line. (A) A protein band of 90 kDa corresponding to HSP90AB1 was detected. Immunoblotting for  $\alpha$ -tubulin (50 kDa) was applied to ensure equal loading of proteins in each lane. Fold expression of HSP90AB1 was assessed relative to HCK1T. The mean HSP90AB1 value for C33A was  $2.3 \pm 0.2$  ( $p < 0.05$ ) compared to HCK1T. (B) A protein band of 90 kDa corresponding to HSP90AB1 was detected. Fold expression of HSP90AB1 was assessed relative to HCK1T. The mean HSP90AB1 value for C33A was  $4.8 \pm 1.1$  ( $p < 0.05$ , Student's *t*-test). Graphical representation of densitometry analysis of the results (mean  $\pm$  SD), is also shown (\*  $p < 0.05$ , Student's *t*-test).
