SUPPLEMENTAL INFORMATION

SUPPLEMENTARY FIGURE LEGENDS

Supplementary Figure 1. Summary of patient survival information for 15 different cancers from the TCGA. Kaplan-Meier depiction of overall survival for the various cancer dataset used. Barplot depicts 5 year survival rate +/- 95% confidence interval.

Supplementary Figure 2. Survival analysis of multiple cancers based on SFRP expression. Kaplan-Meier depictions of 5 year overall survival stratified by SFRP expression (high expression: red, low expression: blue) in fifteen types of cancer. Patients were dichotimized by ROC curve. Significance was determined by log-rank test and associated p values are displayed in the lower right corners of each plot.

Supplementary Figure 3. Re-sampling analysis of the association of *SFRP* expression with patient survival across different cancer types. Hazard ratios for *SFRP* expression on overall survival were conducted on 70% of the dataset and resampled 500 times. Hazard ratios of each *SFRP* across different cancer types were plotted on violin plots.

Supplementary Figure 4. Association of SFRP expression with copy number status in breast cancer. Boxplot depicts (a) *SFRP1*, (b) *SFRP2*, (c) *SFRP3*, (d) *SFRP4*, and (e) *SFRP5* expression values (log₂[RSEM normalized values + 1]) against putative *SFRP* copy number status (GISTIC) for breast cancer patients. Significance was determined by one-way ANOVA followed by Tukey's HSD. Boxplots sharing the same letter are not significantly different according to Tukey's HSD test (p > 0.05).

Supplementary Figure 5. Single cell analysis of SFRP2 and SFRP4 expression in breast cancer. Barplot depicts (a) Stromal and (b) Immune Scores of individual cells from tumour BC02. Cells were identified as stromal or immune if they were >1.75 standard deviations above mean levels. (c) SFRP2 and (d) SFRP4 expression values (transcripts per million, TPM) were summarized based on cell type. Bars depict mean expression values.

Supplementary Figure 6. Correlation matrix of *SFRPs* to each other in fifteen types of cancer. Correlation matrix of the expression levels of different *SFRP* family members ($log_2[RSEM$ normalized values + 1]) in primary tumours from multiple cancers. Positive correlations are displayed in blue and negative correlations in red. Colour intensity and size of the circle are proportional to the correlation coefficients. Pearson's correlation coefficients are identified in the corresponding lower left corners. Correlations that are crossed out are not significant (p > 0.05).

Supplementary Figure 7. Correlation matrix of SFRPs to indicated gene sets in fifteen types of cancer. Correlation matrix of the expression levels of different SFRP family members (log₂[RSEM normalized values + 1]) in primary tumours to indicated gene set enrichment. Positive correlations are displayed in blue and negative correlations in red. Colour intensity and size of the circle are proportional to the correlation coefficients.

Supplementary Table 1. Summary statistics of *SFRP* expression in primary tumours for the 29 tumour types used in this study.

Supplementary Table 2. Summary statistics of *SFRP* expression in normal tissues for the 29 tumour types used in this study.
