**Supplementary Fig. S1.** 5' Rapid Amplification of cDNA Ends (5'tagRACE). **(a)** The TSSs of 6 mRNAs found by dRNA-seq were confirmed using 5'tagRACE and targeted genes were separated by 2.5% agarose gel electrophoresis. **(b)** The 5' end of amplified DNA fragments was confirmed using pyrosequencing.

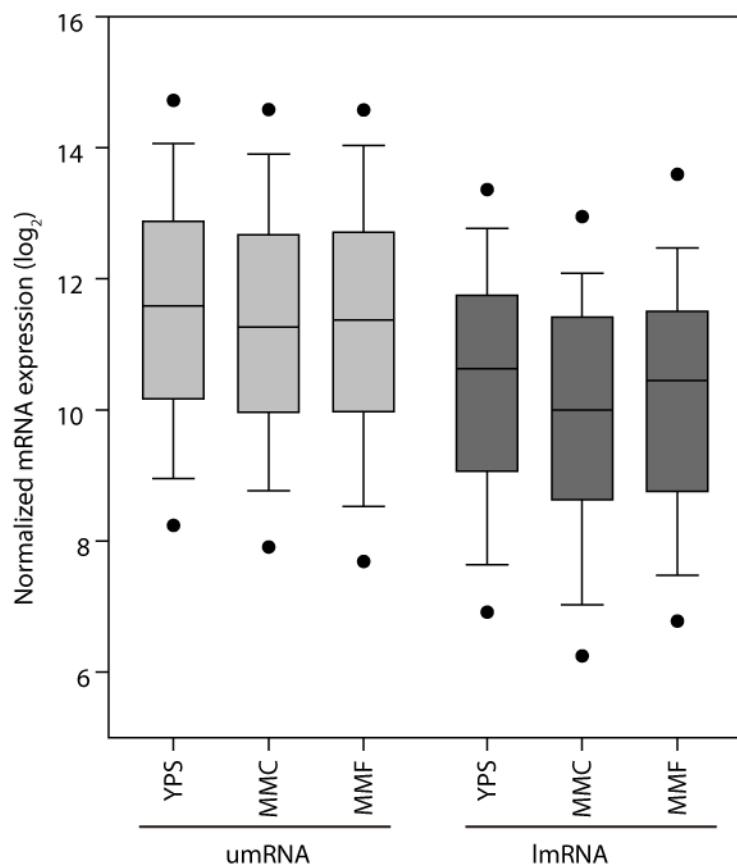

**Supplementary Fig. S2. Distribution of 5' UTR length.** The maximal and median length of 5' UTRs in *T. onnurineus* NA1.

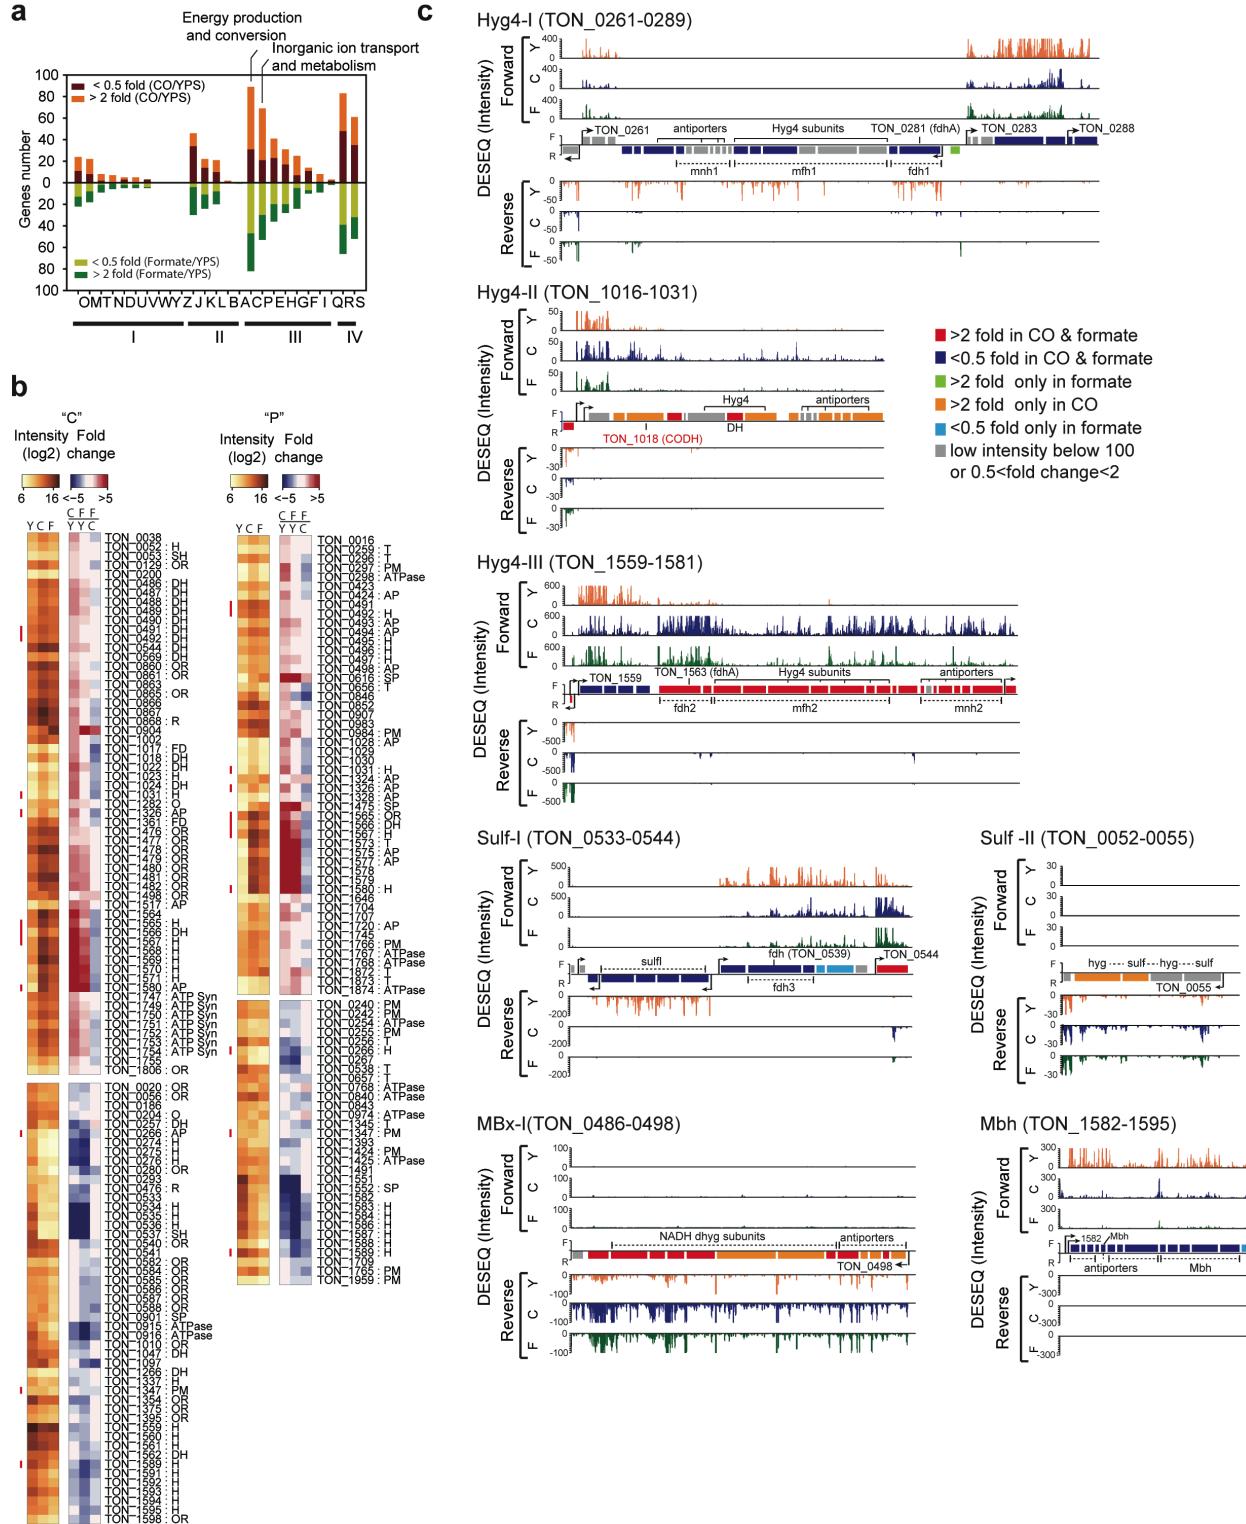

**Supplementary Fig. S3. Promoter motifs upstream of transcription start sites.** (a) The TATA boxes, BREs, and PPE motifs are shown between the TSS (+1) and 40 nt upstream according to primary, secondary, internal, antisense, and intergenic TSS location using MEME. (b) The promoter motifs according to promoter strength. The promoters and BRE motifs were compared for genes corresponding to high (high-ranked 167 genes) and low transcription levels (low-ranked 159 genes) using MEME.

**Supplementary Fig. S4. Differential RNA expression.** (a) Pairwise correlation of RNA expression between the growth conditions of YPS/MMC, MMC/MMF, and YPS/MMF were examined and illustrated with a scatter plot. (b) Quantitative analysis of cellular mRNAs by qRT-PCR. The correlation between  $C_q$  value from qPCR with RPKM from ssRNA-seq was examined for 10 specific mRNAs.

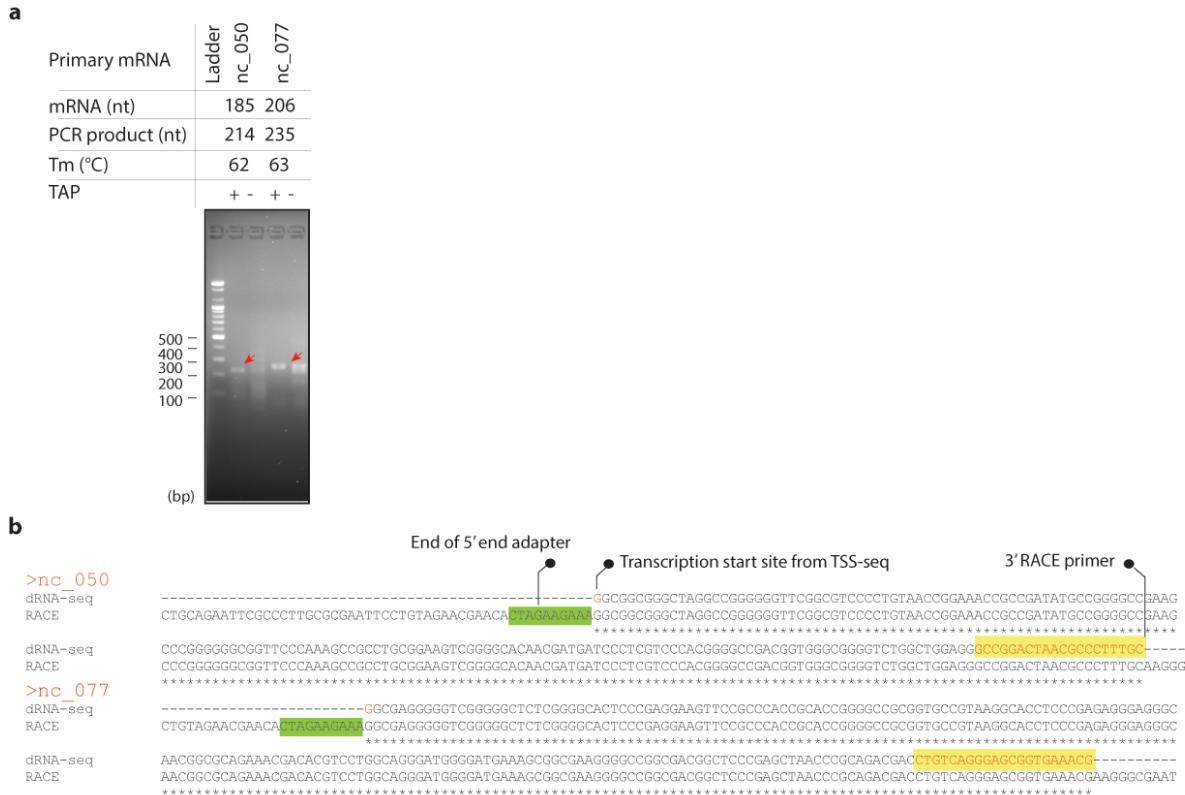

**Supplementary Fig. S5. The box plot of normalized mRNA expression according to the culture media, YPS, MMC, and MMF in leadered mRNA and leaderless mRNA.**

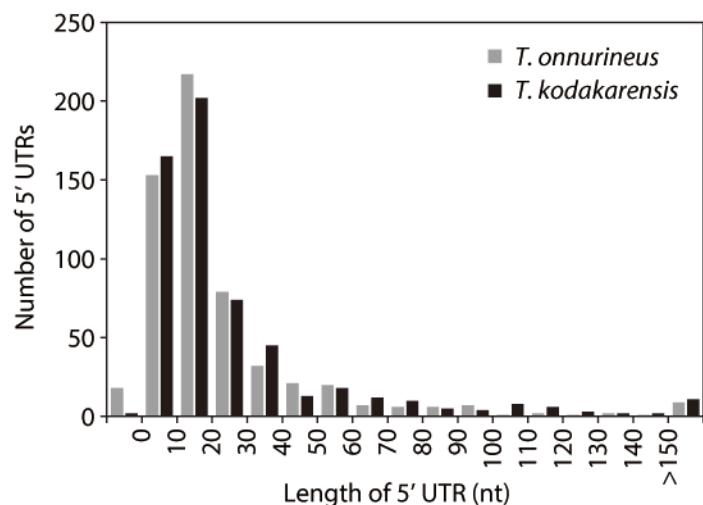

**Supplementary Fig. S6. Differential gene expression.** (a) The functional groups showing differential expression over 2-fold in MMC and MMF against YPS were categorized as I, II, III, and IV (cellular processes and signaling, information storage and processing, metabolism, and poorly characterized) by COG mapping, and further divided into subgroups of each functional group. Significant changes in gene expression were observed in diverse functions including energy production and inorganic ion transport/metabolism as shown in the COG mapping. (b) The changes in expression profiles of genes in various growth media of group C and group P, which were highly activated in (b) were displayed using a heat map with protein function. The left red bar in the heat map indicates the common genes involved in both groups C (energy production and conversion) and P (inorganic ion transport and metabolism).

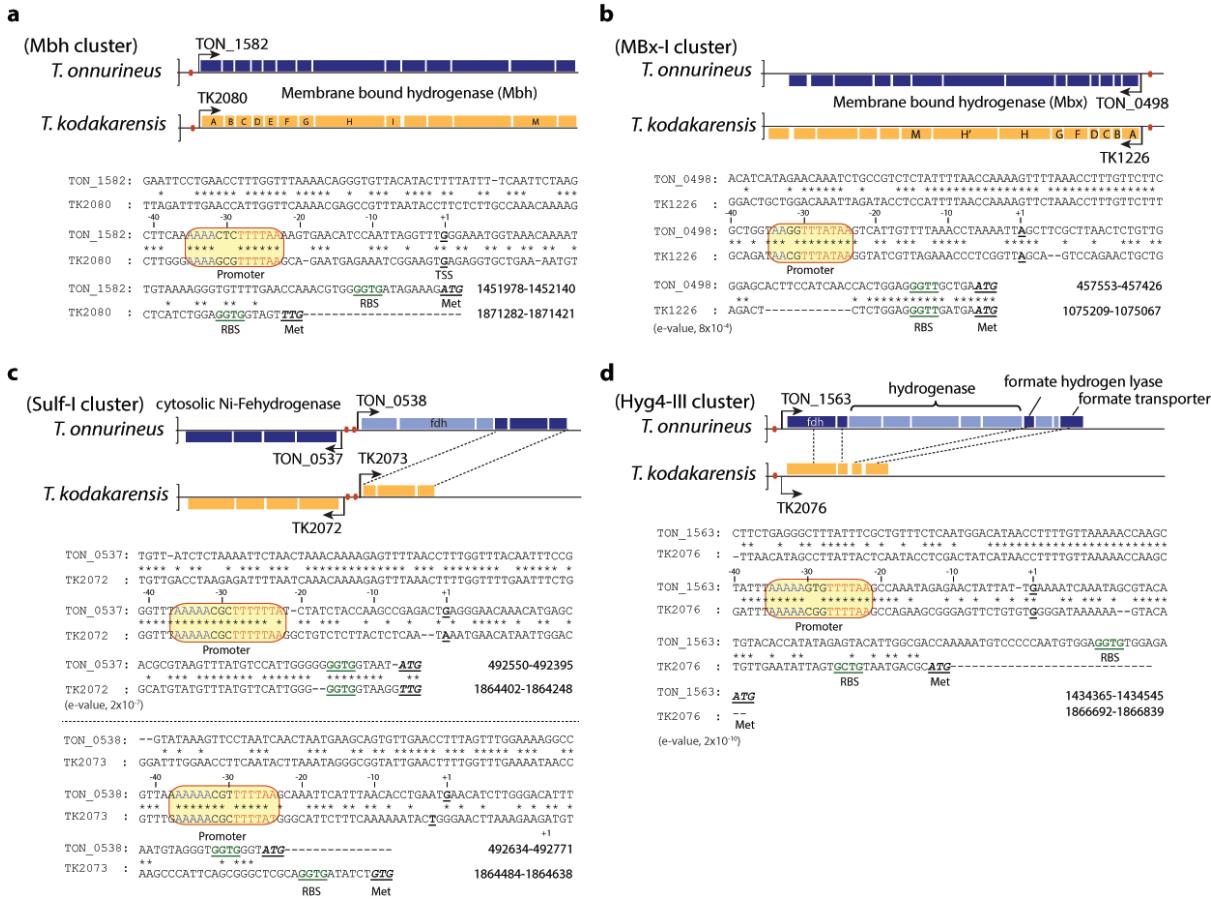

Abbreviations: H, hydrogenase; OR, oxidoreductase; DH, dehydrogenase; R, reductase; FD, ferredoxin; SH, Sulfhydrogenase; O, oxidase; AP, antiporter; PM, permease; T, transporter; SP, symporter. (c) the profile feature by ssRNA-seq. The hydrogenase 4 in three Hyg4 clusters showed differential gene expression in different growth conditions. In Hyg4-I, mfh1 with Hyg4 subunits, fdh1, and mnh1 with antiporters clusters were downregulated in CO and formate conditions. In contrast, all fdh2, mfh2, and mnh2 in Hyg4-III exhibited expression > 2-fold greater in CO and formate conditions but were scarcely expressed in YPS media. The Hyg4-II cluster was expressed only in the presence of CO, while not expressed in formate and YPS conditions. Especially, CO-responsive hydrogenase was substantially activated, and the catalytic subunit of CO dehydrogenase (TON\_1018), a key CO metabolic enzyme, was significantly increased only in CO media. In addition, there are two clusters with sulfhydrogenase and cytosol hydrogenase, Sulf-I and Sulf-II. Their RNA expression was not occurred in the CO and formate media without sulfur but all genes in a Sulf-I cluster were fully activated > 2-fold by sulfur in YPS rich media. Especially, Sulf-I cluster was together with fdh cluster in different operon but at just near Sulf-I cluster. Moreover, fdh3 part was also highly expressed in all conditions but sulfI part activated by sulfur was totally deactivated in all conditions. Sulf-II consists of simple repeated Hyg and Sulf subunits, but entire expression level in all media was very low (RPKM < 30). Membrane bound oxidoreductase (MBx-I) subunits composing of NADH dependent dehydrogenase and antiporters were mostly activated > 2-fold in CO and formate against YPS. In contrast, membrane bound hydrogenase (Mbh) clusters with antiporters were poorly activated in CO and formate media for YPS. Taken together, high hydrogen production in CO and formate media seems to be driven by high expression of Hyg4-II and Hyg4-III clusters with the reduction of transcription of the other hydrogenase clusters.

**Supplementary Fig. S7. TSS determination of ncRNAs by 5' Rapid Amplification of cDNA Ends (5'RACE).** (a) The TSSs of nc\_050 and nc\_077 corresponding to archaeal signal recognition particle RNA and Archaeal RNase P, respectively, were newly found by dRNA-seq and their DNA sizes were confirmed using agarose gel electrophoresis (2.5%). (b) The DNA sequence was determined by Sanger sequencing.

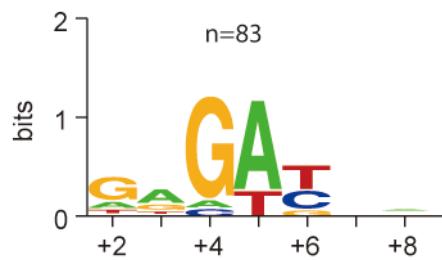

**Supplementary Fig. S8.** The distribution of 5' UTR length of *T. onnurineus* NA1 and *T. kodakarensis* orthologous genes.

**Supplementary Fig. S9. The promoter, its regulatory upstream DNA sequence, and 5' UTR between orthologous genes in *T. onnurineus* and *T. kodakarensis*.**

Among Mbh, MbX-I, and Sulf-I, and Hyg4-III clusters, the upstream sequences of orthologous genes were each aligned and compared. Their promoters, RBSs, and start codons were analyzed together.

**Supplementary Fig. S10. The INR motif in 5' UTRs of *T. onnurineus* NA1.** The initiator element (Inr) motif was searched from positions +2–+8 downstream of TSSs in 328 leadered RNAs which have a 5' UTR length > 19 nt. In result, 83 RNAs showed a conserved GAGAT motif ( $p\text{-val} < 0.05$ ; MEME).

**Supplementary Table 1.** NGS Sequencing results

	dRNA-seq		ssRNA-seq

\*In our study, the direction of genome annotation of TON\_1978 was proven as reverse strand, unlikely annotated as positive strand in current NCBI genome database. Although TON\_nc050 corresponding in reverse strand of TON\_1978 was classified to the ncRNAs (Primary) here, we did not count TON\_nc050 in the number of total 86 ncRNAs .

**Supplementary Table 6.** The function of ncRNAs from Rfam database in *T. onnurineus* NA1
