

Supplementary Note 1

For our initial calculations the cyanamide cation seemed an ideal candidate for two reasons: its positive charge would complement the negative charge in **2** while leaving some electron density on N, and its C_{3v} symmetry renders the computations more economical.

As is summarized in entries 1-3 in Supplementary Table 1, the complexation energies for all three cyanamide structures are negative and fairly large (comparable to hydrogen bonding). This large enthalpy might depend significantly on simple charge compensation. As a matter of fact, the interaction energy of host **2a** with the cyanamide molecule flipped 180 degrees (so that the –NH₃⁺ and nitrile N-atoms switch position, i.e. [2a···N⁺H₃–C≡N], not shown in the table) is –47.7 kcal/mol. This is nearly identical to the interaction energy of complex [2a···N≡C–N⁺H₃] (entry 1, –48.8 kcal/mol), thus confirming that the nature of the interaction is predominantly charge compensation. Interestingly, the least stable of these complexes involves **2c**, which actually had a positive potential on the nitrate's N-atom (see Figure 2b). This implies that the energy gain of charge compensation is largely counteracted by repulsion between the π-hole and the cyanamide cation.

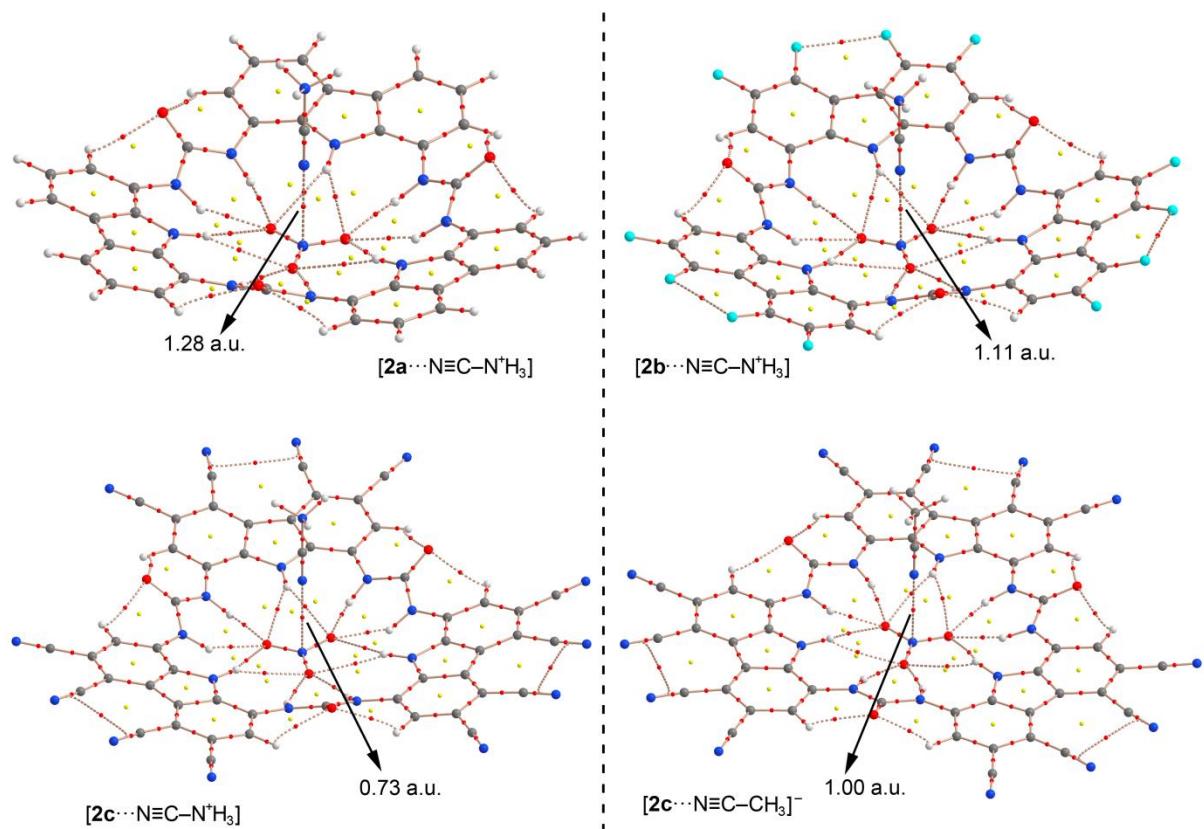

Next we considered the charge neutral species acetonitrile and hydrogen cyanide as electron rich partners for the π-hole in **2c** (entries 4 and 5 in Supplementary Table 1). Interestingly, the estimated binding enthalpies of these ‘pseudo anti-electrostatic’ complexes are negative and in the order of weak hydrogen bonding (up to –7.7 kcal/mol for [2c···N≡CCH₃]⁻).

Stimulated by these findings, we wondered how cyanide, chloride and BF₄⁻ anions would interact with the π-hole in **2c** and if perhaps truly ‘anti-electrostatic’ complexes might be obtained. To our surprise these complexes (entries 6, 7 and 8 in Supplementary Table 1) converged with their initial C_{3v} symmetry intact to give quite large and negative energies: –20.7 kcal/mol for [2c···NC]²⁻, –31.6 kcal/mol for [2c···Cl]²⁻ and –8.2 kcal/mol for [2c···BF₄]²⁻. Such enthalpies are comparable to medium to strong hydrogen bonding. Unsurprisingly, when considering **2a** as partner to these anions (entries 9, 10 and 11 in Supplementary Table 1), the computed enthalpies were fairly large but positive.

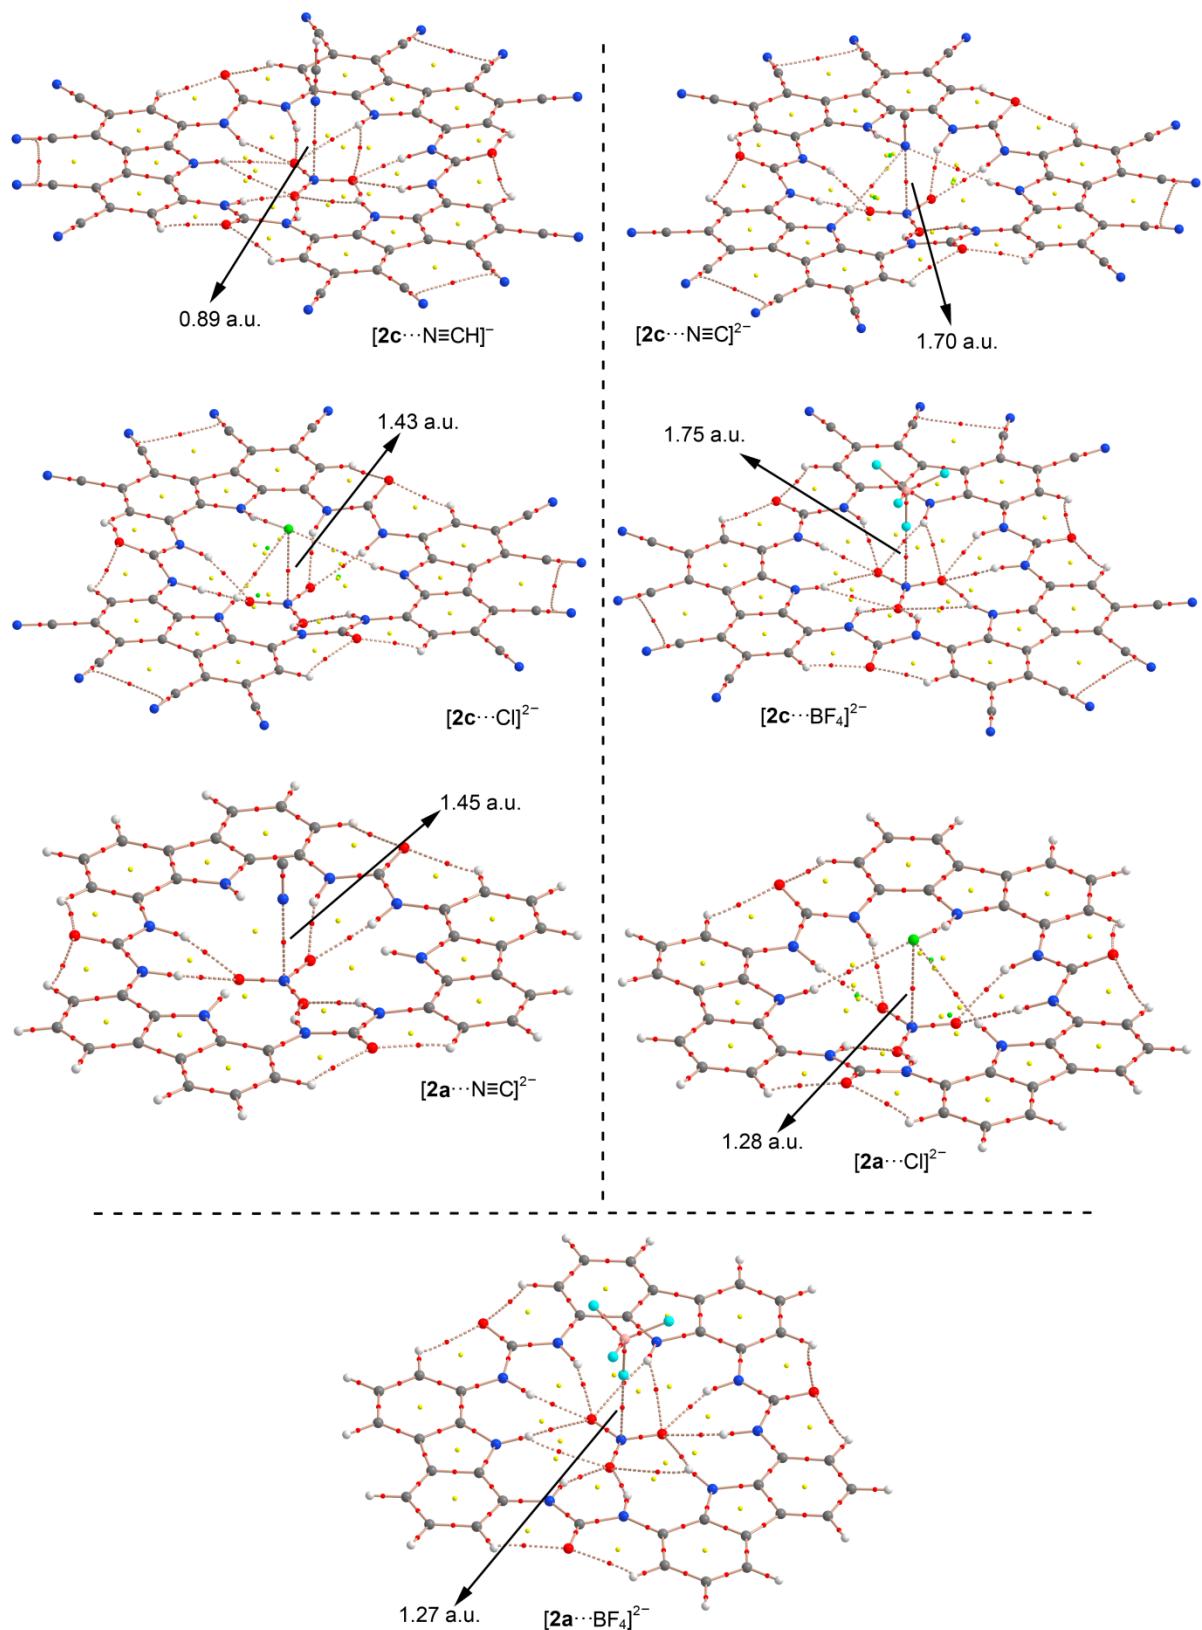

An ‘atoms-in-molecules’ analysis of all complexes (see Supplementary Figures 1 and 2) indicate a single bond critical point between the nitrate's N-atom and the interacting electronegative atom.

Supplementary Note 3

After some deliberation we could not think of a single (common) anion with the combined properties of NO_3^- , i.e.: fairly polarized and further polarizable, not so charge-dense, and flat, i.e. π -hole is sterically accessible. The halides are easily dismissed (point charge) and most other common anions are not flat and sterically too crowded to allow the approach of a Lewis base (e.g. ClO_3^- , BrO_3^- , ClO_4^- , BrO_4^- , BF_4^- , PF_6^-). Anions with two or more charges such as CO_3^{2-} are likely too charge dense. Flat anions such as NO_2^- , N_3^- and CN^- do not seem to be polarized enough and thus also too charge dense, i.e. the maximum potentials are respectively -132 , -142 and -145 kcal/mol versus -110 kcal/mol for NO_3^- (MP2/6-311+G**). They are also intrinsically more charge dense with an atom over charge ratio of 3 (NO_2^- , N_3^-) or 2 (CN^-) versus 4 of nitrate. We also contemplated trifluoroacetate but the maximum potentials (maximum actually lies on the σ -hole of $-CF_3$) are sterically less accessible. A promising candidate might be the rare FCO_2^- (similar MEP as nitrate, only one structure in the CSD and none in the PDB), but this anion is very likely to decompose to F^- and CO_2 . I_3^- (and possibly Hlg_3^- generally) can act as a halogen bond donor but is also prone to decomposition into I^- and I_2 (P. H. Svensson and L. Kloo, *Chemical Reviews*, **2003**, *103*, 1649-1684; at the MP2/6-311+G** level of theory two latent σ -holes are present on I_3^- (-76 kcal/mol), Br_3^- (-87 kcal/mol) and Cl_3^- (-97 kcal/mol)).
