

Supplementary Figure 1. OxLDL-ICs elicit similar cytokine profiles from BMDMs. (A)

BMDMs were treated for 3 hours with oxLDL, oxLDL-ICs, or ApoE-ICs followed by ATP for an additional hour. IL-1 β was measured in culture supernatants by ELISA. Shown is one representative of 3 similar experiments. Error bars represent SD. **(B)** BMDMs were treated with oxLDL, oxLDL-ICs, or ApoE-ICs overnight. TNF α (right) and IL-6 (left) in culture supernatants were measured by ELISA. Shown is one representative of 3 similar experiments. Error bars represent SD.

Supplementary Figure 2. BMDCs were stimulated for 3 hours with oxLDL or oxLDL-IC followed by lysis in RIPA buffer and Western blot for pro-caspase 1 and cleaved caspase-1.
