

Engineering of double recombinant vaccinia virus with enhanced oncolytic potential for solid tumor virotherapy

SUPPLEMENTARY FIGURE

untreated cells

Supplementary Figure S1: The example of the original staining with FAM-DEVD-FMK. MDA-MB-231 cells were treated with VACVs (0.05 PFU/cell) for 36h and then stained with FAM-DEVD-FMK. Stained cells were gated in the FSC/SSC plot (P1) to exclude small debris. Plot P2 indicates the cells staining positive for FAM.
