Figure 3: **Effect of gender bias on the evolurionary rate in *pol* and *env* for subtype B.** Shown are the marginal posterior probability distributions of the mean rate statistic for the *pol* (white background) and *env* (grey background) regions of subtype B. Estimates for the HET risk group are dotted, the estimates for the MSM risk group are striped. The two-sided arrow points at the difference between the means of the estimate of both risk groups for the same genomic region.
