

STAT3 overexpression promotes metastasis in intrahepatic cholangiocarcinoma and correlates negatively with surgical outcome

Supplementary Materials

Supplementary Figure S1: The STAT3 expression are correlated with the prognosis of ICC patients in the two independent cohorts. (A–B) Kaplan-Meier analysis was conducted to determine the relationship between overall survival (OS) and disease-free survival (DFS) of patients from Cohort A ($n = 61$). Subgroups were plotted according to the scores for the STAT3 levels. (C–D) Kaplan-Meier analysis was conducted to determine the relationship between overall survival (OS) and disease-free survival (DFS) of patients from Cohort B ($n = 98$). Subgroups were plotted according to the scores for the STAT3 levels.
