Deletional tolerance prevents AQP4-directed autoimmunity in mice

Supporting Information

Supplementary Figure 1

Supplementary Figure 1. Cell based assay to measure conformational anti-AQP4 antibodies in sera of mice. LN18 cells were either transduced with empty vector ($\text{LN18}^{\text{CTRL}}$ cells, top row) or with an AQP4 expressing lentivirus ($\text{LN18}^{\text{AQP4}}$ cells, bottom row). $\text{LN18}^{\text{CTRL}}$ or $\text{LN18}^{\text{AQP4}}$ cells were incubated with naive serum or anti-AQP4⁺ serum as described in Materials and Methods. Anti-mouse total IgG H+L (AlexaFluor488 labeled) was used to detect anti-AQP4 antibodies bound to $\text{LN18}^{\text{CTRL}}$ cells (shaded histograms) or $\text{LN18}^{\text{AQP4}}$ cells (open histograms). Gating strategy and representative histogram plots. Numbers indicate percentage fractions of parental populations in the respective gates.

Supplementary Table 1

AQP4 peptides (20-mers) overlapping by 15 amino acids and spanning the whole sequence of mouse AQP4 protein.
