SUPPLEMENTARY DATA

MATERIALS AND METHODS

Antibodies and other reagents - Human recombinant interleukin-1 β (IL-1 β), tumor necrosis factor-alpha (TNF α), connective tissue growth factor (CTGF), Wnt-inducible soluble protein 2 (WISP2) and transforming growth factor beta 1 (TGF β 1) proteins were purchased from Peprotech Inc. (Quebec, Canada). We obtained rabbit polyclonal antibodies for Collagen 2 (ab34712), MMP-13 (ab39012), Cox2 (ab15191), Oct4 (ab18976), Nanog (ab106465), CTGF (ab6995), rabbit monoclonal for MMP-3 (ab52915) and mouse monoclonal antibodies for Galectin 3 (ab2785) and β -actin (ab6276) were purchased from Abcam Inc. (CA, USA). Goat polyclonal Brachyury antibody (sc-17743) and rabbit polyclonal antibodies for Aggrecan (sc-25674), TIMP-1 (sc-5538), ADAMTS-4 (sc-25582), TNF α (sc-8301), TGF β 1 (sc-146) and mouse monoclonal WISP2 (sc-514070) were obtained from Santa Cruz Biotechnology Inc. (CA, USA).

RNA isolation and Real Time PCR- Total RNA was isolated from human degenerative disc NP cells (H1 / H2 / H3) treated with IL-1 β (10 ng/mL), TNF α (50 ng/mL), CTGF (100ng/mL), TGF β 1 (10 ng/mL) or a combination of CTGF (100 ng/mL) and TGF β 1 (10 ng/mL) using RNAeasy extraction kit (Cat#74134, Qiagen) and quantified using a Nanodrop spectrophotometer. Total RNA (~ 400ng) was reverse-transcribed using RT² First Strand Kit (Cat#330401, Qiagen) following the manufacturer's instructions for preparing cDNA. Effect of treatment on ECM genes including collagen 2, HAPLN1, versican, thrombospondin 1 (Thbs1), MMP-13 and Cox2 was evaluated using real time PCR performed on ABI 7900HT 384-well Fast block machine.

Cell viability and cell proliferation assays - Nucleus pulposus cells (rat, bovine and human) in passage (P2), were plated in 96-well flat bottom plates in order to evaluate the effect of treatment with growth factors in cell viability and proliferation assays. Rat NP cells (passage, P2) were treated with CTGF, WISP-2 and TGF β 1 in a dose (1 ng/mL – 100 ng/mL) and time dependent manner (24 hrs – 96 hrs) to determine the optimum dose and time for the assessment of these growth factors on viability. Cell viability was determined using 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT, Sigma-Aldrich, USA) as described earlier⁴⁹. We used a BrdU - ELISA (colorimetric) assay (Cat# ab126556, Abcam) for determining the effect of treatment with CTGF (100 ng/mL) or TGF β 1 (10 ng/mL) on human and rat NP cells (healthy / injured) following the manufacturer's instructions. Briefly, NP cells were treated with CTGF (100 ng/mL) or TGF β 1 (10 ng/mL) alone or in combination for 48 hrs following addition of BrdU reagent O/N in each well. Incorporated BrdU in DNA of proliferating cells was determined using anti-BrdU antibody and quantified by ELISA as per the manufacturer's instructions.

Apoptosis assays - Inflammation induced apoptosis in NP cells (rat and human) was determined using Caspase 3/7 and Caspase 9 specific Lumi-Glo assays (Promega, Madison). Briefly, NP cells were plated and treated with either IL-1 β (10 ng/mL) alone or in combination with TNF α (50 ng/mL) only or in presence of CTGF (100 ng/mL) and TGF β 1 (10 ng/mL) for 48 hrs, followed by addition of specific reagents for Caspase 3/7 and Caspase 9 as per the manufacturer's instructions. Cells were incubated for another 4 hrs at 37°C, and plates were read in a multi-well luminescence plate reader.

RESULTS

Histological analysis - Histology of the degenerative disc NPs obtained from human and bovine was compared to healthy NPs obtained from NCD canine and Wistar rat IVDs. Both human and bovine degenerative IVDs showed fibrocartilaginous matrix with strong Safranin-O staining in comparison to healthy, highly cellular NC - rich NP (>90%) with faint Safranin-O staining in NCD – canines and Wistar rat (Supplementary Fig. 2A). Immunohistochemical analysis revealed no detectable expression of Brachyury (NC-specific marker) or Oct4 (stem cell marker) in human and bovine degenerative disc NPs (Supplementary Fig.1A). In contrast, strong nuclear expression of brachyury and Oct4 was observed in healthy, NCD canine and Wistar rat discs demonstrating the NC- and stem cell-rich NP (Supplementary Fig. 2A). However, negative control tissue sections showed no immunostaining demonstrating the specificity of the antibodies (Supplementary Fig. 2B).

FIGURE LEGENDS

Supplementary Fig. 1. (A) Histological changes in rat disc NP in a time dependent manner (healthy – 10 weeks p.i.) with hematoxylin and eosin (H&E) staining showing loss of NCs and Safranin-O (Saf-O) staining showing development of fibrocartilaginous matrix (Scale bar 50 μ). Panel (B) represents histograms showing fold changes in protein expression of IL1 β , TNF α , Cox2, MMP-3, MMP-13, TIMP1 and ADAMTS-4. Panel (C) represents histograms showing fold changes in protein expression of Brachyury, Galectin3, Oct4 and Nanog. Each bar in the histogram represents mean \pm S.D. of 3 independent experiments. ***p<0.05; *p-values are w.r.t No treatment controls; **p-values are w.r.t 10 weeks p.i.

Supplementary Fig. 2. Panel (A) Safranin O staining and immunohistochemical analysis of brachyury and Oct4 proteins in paraffin embedded sections of nucleus pulposus obtained from human degenerative disc, bovine degenerative disc, non-chondrodystrophic canine and healthy rat discs (Scale bar 10 μ). Arrows represent CLC, chondrocyte like cells and NC, notochordal cells. Panel (B) shows representative negative controls showing no immunostaining in tissue sections (rat healthy or mongrel IVD-NP), wherein specific rabbit or goat polyclonal antibodies were replaced by isotype controls (Scale bar 50 μ). Panel (C) represents histograms showing fold changes in protein expression of Collagen2, Oct4 and Nanog in rat IVD-NP injected with PBS, control media or NCCM. Each bar in the histogram represents mean \pm S.D. of 3 independent experiments. ***p<0.05; *p-values are w.r.t No treatment controls; **p-values are w.r.t 10 weeks p.i.

Supplementary Fig. 3. Evaluation of bioactivity in protein containing fractions (PF) collected after size exclusion chromatography. Histograms showing (A) cell viability, (B) caspase-3/7

activity in bovine NP cells treated with NCCM, the cytotoxic drug, etoposide (300 µM, used as a positive control) in presence of NCCM or control medium (serum, phenol red and protein free Hybridoma Media). Each bar represents mean \pm S.D. of 2 independent experiments done in triplicates (n=6). (C) Histograms showing caspase-3/7 activity in bovine NP cells treated with etoposide in control medium (serum free, phenol red free Hybridoma Media) or in presence of protein containing fractions (PFs). Each bar represents mean \pm S.D. of 2 independent experiments done in triplicates (n=6). For these experiments, protein containing fractions (PFs) were mixed (1:1) with control medium (serum free, phenol red free Hybridoma Media) and compared to no treatment controls (i.e. elution buffer + control medium (1:1)).

Supplementary Fig. 4. Ingenuity Pathway Analysis showing (A) Canonical signaling pathways identified. (B) Radial model showing CTGF as important hub proteins regulating / interacting with several other growth factors and ECM proteins. (C) Protein network involved in cartilage development and degradation; (D) and (E) Cell signaling involved in axonal growth. Proteins highlighted were identified in the secretome analysis.

Supplementary Fig. 5. Dose (5 ng/mL – 100 ng/mL) and time dependent (24 hrs - 96 hrs) effects of (A) CTGF, (B) WISP2 and (C) TGF β 1 treatment alone or (D) combination of CTGF with WISP2, and TGF β 1 on cell viability determined using MTT assays in NP cells obtained from healthy rat IVDs. Each bar represents mean \pm S.D. of 3 independent experiments done in quadruplicates (n=12).

Supplementary Fig. 6. Effect of CTGF, WISP2 and TGF β 1 treatment alone or in combination on cell viability as determined using MTT assays in NP cells obtained from (A) rat (healthy / injured) disc, *p \leq 0.02, (B) bovine degenerative disc, *p<0.01 and (C) human (H1, H2)

degenerative NP cells in 48 hrs (*p<0.005, **p=0.02). Each bar represents mean \pm S.D. of 3 independent experiments done in triplicates (n=9).

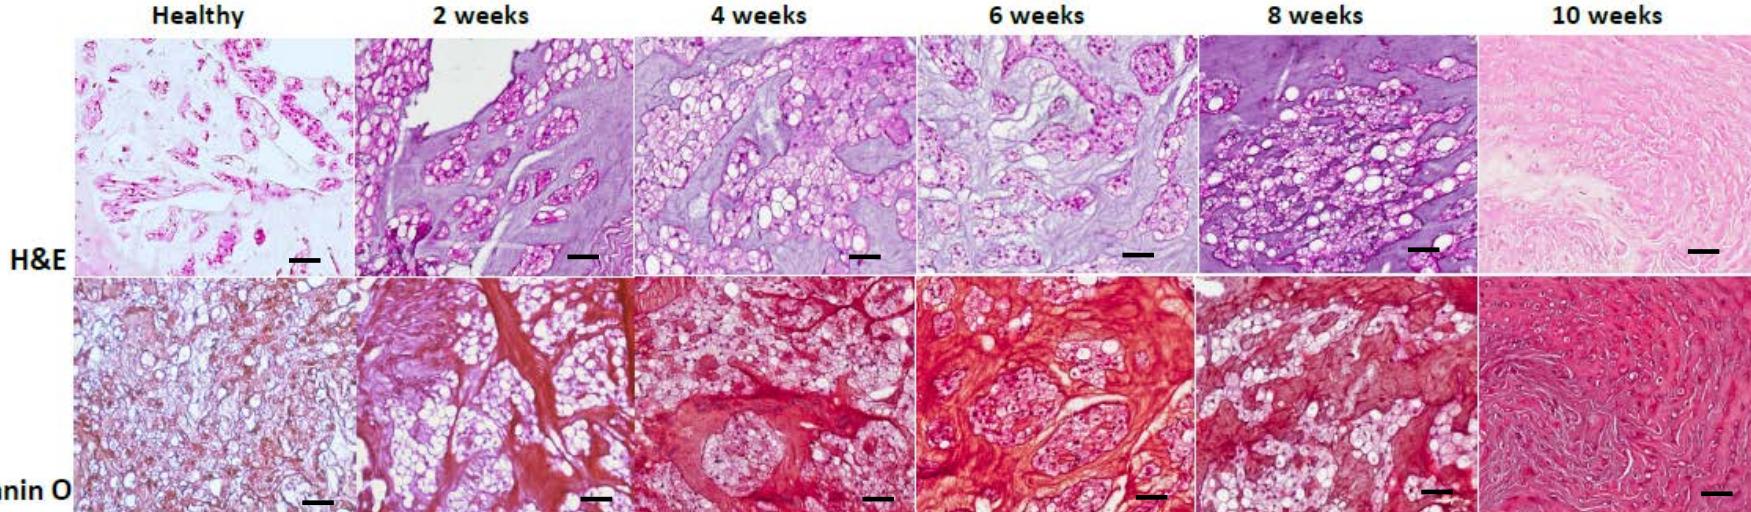

Supplementary Fig. 7. Panel (A) shows a representative Western blot panel verifying increased collagen 2 expression in human degenerative disc NP cells (#H2) on treatment with CTGF and TGF β 1. Panel (B) represents histograms showing fold changes in protein expression of Collagen2 in human NP cells treated with CTGF, TGF β 1 alone or in combination as compared to no treatment controls (NTC).

Supplementary Fig. 8. Panel (A) represents histograms showing fold changes in protein expression of MMP-3, MMP-13 and Cox2 on treatment with IL1 β alone or in presence of CTGF, WISP2 or TGF β 1. Panel (B) represents histograms showing fold changes in protein expression of MMP-3, MMP-13 and Cox2 on treatment with IL1 β and TNF α alone or in presence of CTGF, WISP2 or TGF β 1. Each bar in the histogram represents mean \pm S.D. of 5 independent experiments. ***p<0.05; *p-values are w.r.t No treatment controls (NTC); **p-values are w.r.t IL1 β or a combination of IL1 β and TNF α .

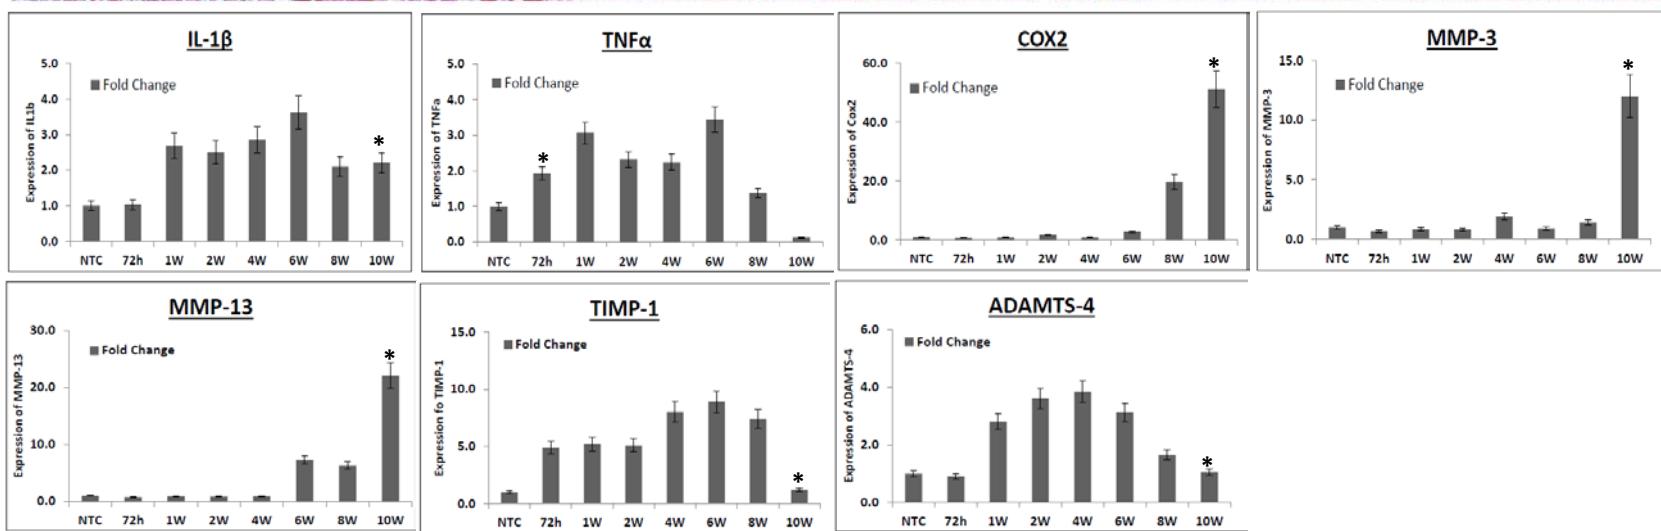

Supplementary Fig. 9. Panel represents histograms showing fold change in protein expression of MMP-13, Cox2, Brachyury and Oct4 in rat IVD-NP injected with PBS, CTGF, TGF β 1 alone or in combination. **p<0.05; p-values are w.r.t PBS controls. Each bar in the histogram represents mean \pm S.D. of 3 independent experiments.
