

1 **Supplemental material**

2

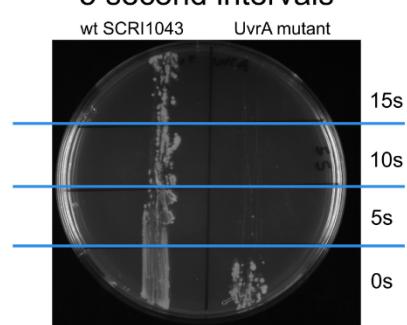

A No UV exposure

B 2 second intervals

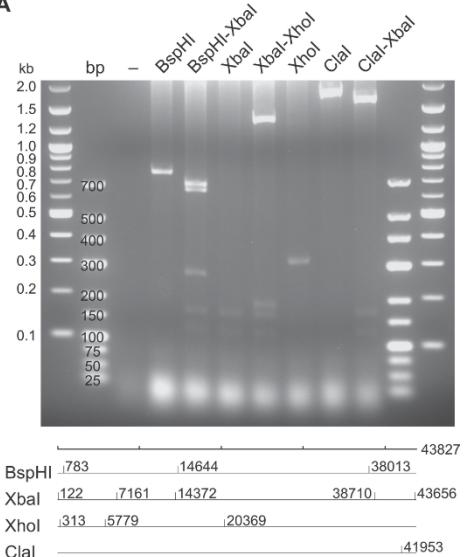

C 5 second intervals

3

4 FIG S1 UV sensitivity test against *P. atrosepticum* and the *uvrA* mutant. (A) Without exposure to
5 UV light there is no observable difference in growth between wt SCRI1043 and the *uvrA* mutant.
6 (B), and (C) show different UV exposures at two and five seconds intervals respectively. The
7 growth of the *uvrA* mutant is significantly reduced in these conditions while the wt strain shows
8 a less dramatic effect.

A

B

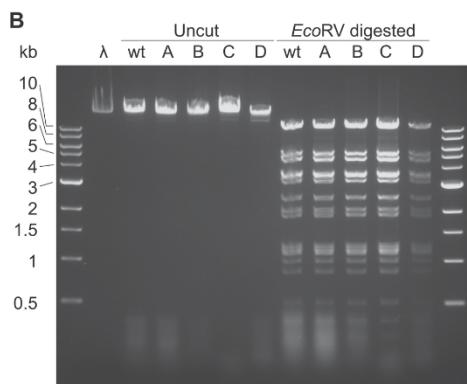

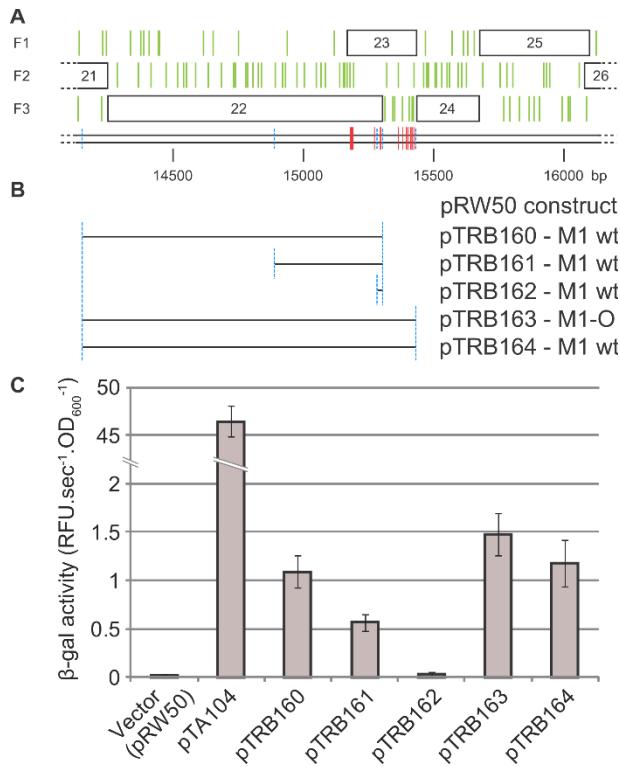

FIG S2 Restriction digest analysis of ΦM1 wt and escape phages. (A) ΦM1 wt contains DTRs of approximately 293 bp. Fourteen µg of ΦM1 wt genomic DNA was digested with the indicated enzymes for 3 h, then separated by gel electrophoresis within a 2% agarose gel. The restriction pattern matched the predicted digest from the finalised ΦM1 wt genomic sequence, as indicated below the gel image. An uncut sample lane is shown in “-”. (B) There are no gross genetic changes between ΦM1 wt and the selected escape phages ΦM1 A, B, C and D. Genomic DNA from each phage was digested with EcoRV for 3 hours then separated by gel electrophoresis within a 1% agarose gel. Genomic DNA from phage λ (48,502 bp) was used as a high molecular weight marker for genomic DNA sizing.

19

20

21 FIG S3 *phiM1-23* has a weak promoter upstream. (A) and (B) Sections of the ΦM1 escape locus
 22 were cloned into the LacZ reporter plasmid pRW50. Blue dotted lines in (A) reflect the construct
 23 boundaries in (B). The figure is drawn to scale. (C) These constructs were tested for LacZ
 24 activity in liquid assays. There is a promoter immediately upstream of *phiM1-23*, though the
 25 activity is weak compared to the positive control, pTA104, which contains the constitutive
 26 ToxIN_{Pa} promoter.
