5823 [Cluster 530]GO:0005652+C cellular\_component [name] nuclear lamina [def] "The fibrous, electron-dense layer lying on the nucleoplasmic side of the inner membrane of a cell nucleus, composed of lamin filaments. The polypeptides of the lamina are thought to be concerned in the dissolution of the nuclear envelope and its re-formation during mitosis. The lamina is composed of lamin A and lamin C filaments cross-linked into an orthogonal lattice, which is attached via lamin B to the inner nuclear membrane through interactions with a lamin B receptor, an IFAP, in the membrane." [ISBN]

5889 [Cluster 536]GO:0005730+C cellular\_component [name] nucleolus [def] "A small, dense body one or more of which are present in the nucleus of eukaryotic cells. It is rich in RNA and protein, is not bounded by a limiting membrane, and is not seen during mitosis. Its prime function is the transcription of the nucleolar DNA into 45S ribosomal-precursor RNA, the processing of this RNA into 5.8S, 18S, and 28S components of ribosomal RNA, and the association of these components with 5S RNA and proteins synthesized outside the nucleolus. This association results in the formation of ribonucleoprotein precursors\_ these pass into the cytoplasm and mature into the 40S and 60S subunits of the ribosome."

5900 [Cluster 537]GO:0035101+C cellular\_component [name] FACT complex [def] "An abundant  
 nuclear complex, which was originally identified in mammalian systems as a factor  
 required for transcription elongation on chromatin templates. The FACT complex has been  
 shown to destabilize the interaction between the H2A/H2B dimer and the H3/H4 tetramer of  
 the nucleosome, thus reorganizing the structure of the nucleosome. In this way, the FACT  
 complex may play a role in DNA replication and other processes that traverse the  
 chromatin, as well as in transcription elongation. FACT is composed of two proteins that  
 are evolutionarily conserved in all eukaryotes and homologous to mammalian Spt16 and  
 SSRP1. In metazoans, the SSRP1 homolog contains an HMG domain\_ however in fungi and  
 protists, it does not. For example, in *S. cerevisiae* the Pob3 protein is homologous to  
 SSRP1, but lacks the HMG chromatin binding domain. Instead, the yFACT complex of Spt16p  
 and Pob3p, binds to nucleosomes where multiple copies of the HMG-domain containing  
 protein Nhp6p have already bound, but Nhp6p does not form a stable complex with the  
 Spt16p/Pob3p heterodimer." [GOC

6032 [Cluster 549]GO:0008622+C cellular\_component [name] epsilon DNA polymerase complex [def] "A heterotetrameric DNA polymerase complex that catalyzes processive DNA synthesis in the absence of PCNA, but is further stimulated in the presence of PCNA. The complex contains a large catalytic subunit and three small subunits, and is best characterized in *Saccharomyces*, in which the subunits are named Pol2p, Dpb2p, Dpb3p, and Dpb4p. Some evidence suggests that DNA polymerase epsilon is the leading strand polymerase\_ it is also involved in nucleotide-excision repair and mismatch repair." [PMID

- 6395 [Cluster 582]GO:0005669+C cellular\_component [name] transcription factor TFIID complex [def] "A complex composed of TATA binding protein (TBP) and TBP associated factors (TAFs)\_ the total mass is typically about 800 kDa. Most of the TAFs are conserved across species. In TATA-containing promoters for RNA polymerase II (Pol II), TFIID is believed to recognize at least two distinct elements, the TATA element and a downstream promoter element. TFIID is also involved in recognition of TATA-less Pol II promoters. Binding of TFIID to DNA is necessary but not sufficient for transcription initiation from most RNA polymerase II promoters." [GOC

6439 [Cluster 586]GO:0005665+C cellular\_component [name] DNA-directed RNA polymerase II, core complex [def] "RNA polymerase II, one of three nuclear DNA-directed RNA polymerases found in all eukaryotes, is a multisubunit complex\_ typically it produces mRNAs, snRNAs, and some of the snRNAs. Two large subunits comprise the most conserved portion including the catalytic site and share similarity with other eukaryotic and bacterial multisubunit RNA polymerases. The largest subunit of RNA polymerase II contains an essential carboxyl-terminal domain (CTD) composed of a variable number of heptapeptide repeats (YSPTSPS). The remainder of the complex is composed of smaller subunits (generally ten or more), some of which are also found in RNA polymerases I and III. Although the core is competent to mediate ribonucleic acid synthesis, it requires additional factors to select the appropriate template." [GOC

6868 [Cluster 625]GO:0044300+C cellular\_component [name] cerebellar mossy fiber [def] "An axon arising from cerebellar projecting cells in the cochlea, vestibular nuclei, spinal cord, reticular formation, cerebellar nuclei and basilar pontine nuclei. Mossy fibers enter through all three cerebellar peduncles and send collaterals to the deep cerebellar nuclei, then branch in the white matter and terminate in the granule cell layer. Through this branching, a given mossy fiber can innervate several folia. Mossy fibers synapse on granule cells. The synaptic contacts are made at enlargements along the length of the mossy fiber called mossy fiber rosettes. The enlargements of the rosettes give the axons as \"mossy\" appearance in Golgi stained preparations." [NIF\_Subcellular

- 7220 [Cluster 657]GO:0071013+C cellular\_component [name] catalytic step 2 spliceosome [def] "A spliceosomal complex that contains three snRNPs, including U5, bound to a splicing intermediate in which the first catalytic cleavage of the 5' splice site has occurred. The precise subunit composition differs significantly from that of the catalytic step 1, or activated, spliceosome, and includes many proteins in addition to those found in the associated snRNPs." [GOC
- 7221 Pathogen[ Q2Q067] interacts with 59 human partners: {Q9UNP9;O43290;Q13573;P07910;Q9Y333;Q8WUQ7;Q9H2H8;O95391;P52272;P61326;Q15459;P62318;O43390;Q13435;Q96DI7;P38919;O60506;Q9H307;Q9ULR0;Q07955;O94906;P31943;P62314;P61978;P38159;P62304;Q8IYB3;Q86V81;Q96DF8;Q6P2Q9;Q6NZY4;Q9UBB9;P08579;P52597;P14678;Q9Y5S9;Q01081;O75533;P09661;Q15029;Q9P013;Q9HCG8;Q9UQ35;Q9BRR8;P62316;O60508;P62306;P22626;P11940;Q14331;P62308;Q9UMS4;Q99459;Q12874;Q00839;Q9HCS7;O43660;P62310;Q15428}

1042 [Cluster 175]GO:0016236+P biological\_process [name] macroautophagy [def] "The major inducible pathway for the general turnover of cytoplasmic constituents in eukaryotic cells, it is also responsible for the degradation of active cytoplasmic enzymes and

organelles during nutrient starvation. Macroautophagy involves the formation of double-membrane-bounded autophagosomes which enclose the cytoplasmic constituent targeted for degradation in a membrane-bounded structure, which then fuse with the lysosome (or vacuole) releasing a single-membrane-bounded autophagic bodies which are then degraded within the lysosome (or vacuole). Though once thought to be a purely non-selective process, it appears that some types of macroautophagy, e.g. macropexophagy, macromitophagy, may involve selective targeting of the targets to be degraded." 3076 [Cluster 509]GO:0030204+P biological\_process [name] chondroitin sulfate metabolic process [def] "The chemical reactions and pathways involving chondroitin sulfate, any member of a group of 10-60 kDa glycosaminoglycans, widely distributed in cartilage and other mammalian connective tissues, the repeat units of which consist of beta-(1,4)-linked D-glucuronyl beta-(1,3)-N-acetyl-D-galactosamine sulfate. They usually occur linked to a protein to form proteoglycans. Two subgroups exist, one in which the sulfate is on the 4-position (chondroitin sulfate A) and the second in which it is in the 6-position (chondroitin sulfate C). They often are polydisperse and often differ in the degree of sulfation from tissue to tissue. The chains of repeating disaccharide are covalently linked to the side chains of serine residues in the polypeptide backbone of a protein by a glycosidic attachment through the trisaccharide unit galactosyl-galactosyl-xylosyl. Chondroitin sulfate B is more usually known as dermatan sulfate." [GOC]

10564 [Cluster 1688]GO:0019953+P biological\_process [name] sexual reproduction [def] "The regular alternation, in the life cycle of haplontic, diplontic and diplohaplontic organisms, of meiosis and fertilization which provides for the production offspring. In diplontic organisms there is a life cycle in which the products of meiosis behave directly as gametes, fusing to form a zygote from which the diploid, or sexually reproductive polyploid, adult organism will develop. In diplohaplontic organisms a haploid phase (gametophyte) exists in the life cycle between meiosis and fertilization (e.g. higher plants, many algae and Fungi)\_ the products of meiosis are spores that develop as haploid individuals from which haploid gametes develop to form a diploid zygote\_ diplohaplontic organisms show an alternation of haploid and diploid generations. In haplontic organisms meiosis occurs in the zygote, giving rise to four haploid cells (e.g. many algae and protozoa), only the zygote is diploid and this may form a resistant spore, tiding organisms over hard times." [ISBN

3831 [Cluster 685]GO:0051393+F molecular\_function [name] alpha-actinin binding [def] "Interacting selectively and non-covalently with alpha-actinin, one of a family of proteins that cross-link F-actin as antiparallel homodimers. Alpha-actinin has a molecular mass of 93-103 KDa\_ at the N-terminus there are two calponin homology domains, at the C-terminus there are two EF-hands. These two domains are connected by the rod domain. This domain is formed by triple-helical spectrin repeats." [PMID

1195 [Cluster 188]GO:0017146+C cellular\_component [name] N-methyl-D-aspartate selective glutamate receptor complex [def] "An assembly of four or five subunits which form a structure with an extracellular N-terminus and a large loop that together form the ligand binding domain. The C-terminus is intracellular. The ionotropic glutamate receptor complex itself acts as a ligand gated ion channel\_ on binding glutamate, charged ions pass through a channel in the center of the receptor complex. NMDA receptors are composed of assemblies of NR1 subunits (Figure 3) and NR2 subunits, which can be one of four separate gene products (NR2A-D). Expression of both subunits are required to form functional channels. The glutamate binding domain is formed at the junction of NR1 and NR2 subunits. NMDA receptors are permeable to calcium ions as well as being permeable to other ions. Thus NMDA receptor activation leads to a calcium influx into the post-synaptic cells, a signal thought to be crucial for the induction of NMDA-receptor dependent LTP and LTD." [http

1242 [Cluster 194]GO:0005790+C cellular\_component [name] smooth endoplasmic reticulum [def] "The smooth endoplasmic reticulum (ER) has with no ribosomes attached to it. The smooth is the recipient of the proteins synthesized in the rough ER. Those proteins to be exported are passed to the Golgi complex, the resident proteins are returned to the rough ER and the lysosomal proteins after phosphorylation of their mannose residues are passed to the lysosomes. Glycosylation of the glycoproteins also continues. The smooth ER is the site of synthesis of lipids, including the phospholipids. The membranes of the smooth ER also contain enzymes that catalyze a series of reactions to detoxify both lipid-soluble drugs and harmful products of metabolism. Large quantities of certain compounds such as phenobarbital cause an increase in the amount of the smooth ER." [ISBN
