[def] "Interacting selectively and non-covalently with a activating transcription factor and also with the basal transcription machinery in order to increase the frequency, rate or extent of transcription. Cofactors generally do not bind DNA, but rather mediate protein-protein interactions between activating transcription factors and the basal transcription machinery." [GOC

- 8364 [Cluster 761]GO:0050733+F molecular\_function [name] RS domain binding [def]  
 "Interacting selectively and non-covalently with an RS domain of a protein\_ RS domains are usually highly phosphorylated and characterized by the presence of arginine (R)/serine (S) dipeptides. The RS domain promotes protein-protein interactions and directs subcellular localization and, in certain situations, nucleocytoplasmic shuttling of individual SR proteins. They also play a role in splicing." [PMID

279 [Cluster 26]GO:0015030+C cellular\_component [name] Cajal body [def] "A class of nuclear body, first seen after silver staining by Ramon y Cajal in 1903, enriched in small nuclear ribonucleoproteins, and certain general RNA polymerase II transcription factors\_ ultrastructurally, they appear as a tangle of coiled, electron-dense threads roughly 0.5 micrometers in diameter\_ involved in aspects of snRNP biogenesis\_ the protein coilin serves as a marker for Cajal bodies. Some argue that Cajal bodies are the sites for preassembly of transcriptosomes, unitary particles involved in transcription and processing of RNA." [http

345 [Cluster 32]GO:0005786+C cellular\_component [name] signal recognition particle, endoplasmic reticulum targeting [def] "A ribonucleoprotein particle of 325 kDa composed of a 7S (300 nucleotide) RNA molecule and a complex of six different polypeptides. This binds both to the N-terminal signal peptide for proteins destined for the endoplasmic reticulum as they emerge from the large ribosomal subunit and also to the ribosome. This binding arrests further translation thereby preventing the proteins from being released into the cytosol. The SRP-ribosome complex then diffuses to the endoplasmic reticulum where it is bound to the signal recognition particle receptor, which allows resumption of protein synthesis and facilitates the passage of the growing polypeptide chain through the translocon. Through a process involving GTP hydrolysis, the SRP-SRP receptor complex dissociates and SRP returns to the cytosol. Of the six polypeptides of SRP the 54 kDa subunit (SRP54) is the central player. It contains an N-terminal GTPase domain and a C-terminal domain that binds directly to the signal peptide and the SRP RNA. Examples of this component are found in *Mus musculus*, *Saccharomyces cerevisiae* and *Arabidopsis thaliana*." [GOC

complex [def] "A ribonucleoprotein that binds to specific sites in, and is required for  
cleavage of, the 3'-end of histone pre-mRNAs. The complex contains the U7 snRNP and  
additional proteins, including the stem-loop binding protein (SLBP) and the exonuclease  
3'hExo/Eri-1." [GOC

554 [Cluster 51]GO:0008278+C cellular\_component [name] cohesin complex [def] "A protein  
complex that is required for sister chromatid cohesion in eukaryotes. The cohesin complex  
forms a molecular ring complex, and is composed of structural maintenance of chromosomes  
(SMC) and kleisin proteins. For example, in yeast, the complex is composed of the SMC  
proteins Smc1p and Smc3p, and the kleisin protein Scclp. In vertebrates, the complex is  
composed of the SMC1 (SMC1A or SMC1B) and SMC3 heterodimer attached via their hinge  
domains to a kleisin (RAD21, REC8 or RAD21L) which links them, and one STAG protein  
(STAG1, STAG2 or STAG3)." [GOC

Both subunits contain GTPase domains with which signal recognition particle interacts. In the presence of GTP and SRP receptor, SRP is released from the ribosome-nascent chain complex." [ISBN

"Organelle consisting of networks of 60nm tubules organized around the microtubule  
organizing centre in some cell types. They transport receptors from late endosomes back  
to the plasma membrane for recycling and are also involved in membrane trafficking." [GOC

741 [Cluster 68]GO:0005794+C cellular\_component [name] Golgi apparatus [def] "A compound membranous cytoplasmic organelle of eukaryotic cells, consisting of flattened, ribosome-free vesicles arranged in a more or less regular stack. The Golgi apparatus differs from the endoplasmic reticulum in often having slightly thicker membranes, appearing in sections as a characteristic shallow semicircle so that the convex side (cis or entry face) abuts the endoplasmic reticulum, secretory vesicles emerging from the concave side (trans or exit face). In vertebrate cells there is usually one such organelle, while in invertebrates and plants, where they are known usually as dictyosomes, there may be several scattered in the cytoplasm. The Golgi apparatus processes proteins produced on the ribosomes of the rough endoplasmic reticulum\_ such processing includes modification of the core oligosaccharides of glycoproteins, and the sorting and packaging of proteins for transport to a variety of cellular locations. Three different regions of the Golgi are now recognized both in terms of structure and function

1500 [Cluster 137]GO:0005874+C cellular\_component [name] microtubule [def] "Any of the  
long, generally straight, hollow tubes of internal diameter 12-15 nm and external  
diameter 24 nm found in a wide variety of eukaryotic cells\_ each consists (usually) of 13  
protofilaments of polymeric tubulin, staggered in such a manner that the tubulin monomers  
are arranged in a helical pattern on the microtubular surface, and with the alpha/beta  
axes of the tubulin subunits parallel to the long axis of the tubule\_ exist in  
equilibrium with pool of tubulin monomers and can be rapidly assembled or disassembled in  
response to physiological stimuli\_ concerned with force generation, e.g. in the spindle."

1577 [Cluster 144]GO:0032154+C cellular\_component [name] cleavage furrow [def] "In animal cells, the first sign of cleavage, or cytokinesis, is the appearance of a shallow groove in the cell surface near the old metaphase plate. A contractile ring containing actin and myosin is located just inside the plasma membrane at the location of the furrow. Ring contraction is associated with centripetal growth of the membrane that deepens the cleavage furrow and divides the cytoplasm of the two daughter cells. While the term 'cleavage furrow' was initially associated with animal cells, such a structure occurs in many other types of cells, including unicellular protists." [ISBN

Two large subunits comprise the most conserved portion including the catalytic site and share similarity with other eukaryotic and bacterial multisubunit RNA polymerases. The remainder of the complex is composed of smaller subunits (generally ten or more), some of which are also found in RNA polymerase I and others of which are also found in RNA polymerases I and II. Although the core is competent to mediate ribonucleic acid synthesis, it requires additional factors to select the appropriate template." [GOC

It forms a disc that consists of a range of proteins with different functions, some of which contact the cytoplasmic domains of ion channels in the postsynaptic membrane. The proteins making up the disc include receptors, and structural proteins linked to the actin cytoskeleton. They also include signalling machinery, such as protein kinases and phosphatases." [GOC

2380 [Cluster 217]GO:0045202+C cellular\_component [name] synapse [def] "The junction between a nerve fiber of one neuron and another neuron or muscle fiber or glial cell\_ the site of interneuronal communication. As the nerve fiber approaches the synapse it enlarges into a specialized structure, the presynaptic nerve ending, which contains mitochondria and synaptic vesicles. At the tip of the nerve ending is the presynaptic membrane\_ facing it, and separated from it by a minute cleft (the synaptic cleft) is a specialized area of membrane on the receiving cell, known as the postsynaptic membrane. In response to the arrival of nerve impulses, the presynaptic nerve ending secretes molecules of neurotransmitters into the synaptic cleft. These diffuse across the cleft and transmit the signal to the postsynaptic membrane." [ISBN

 "A ubiquitin ligase complex in which a cullin from the Cull1 subfamily and a RING domain protein form the catalytic core\_ substrate specificity is conferred by a Skp1 adaptor and an F-box protein. SCF complexes are involved in targeting proteins for degradation by the proteasome. The best characterized complexes are those from yeast and mammals (with core subunits named Cdc53/Cull1, Rbx1/Hrt1/Roc1)." [PMID]

- 2501 [Cluster 228]GO:0005882+C cellular\_component [name] intermediate filament [def] "A cytoskeletal structure that forms a distinct elongated structure, characteristically 10 nm in diameter, that occurs in the cytoplasm of eukaryotic cells. Intermediate filaments form a fibrous system, composed of chemically heterogeneous subunits and involved in mechanically integrating the various components of the cytoplasmic space. Intermediate filaments may be divided into five chemically distinct classes

2534 [Cluster 231]GO:0005826+C cellular\_component [name] actomyosin contractile ring [def] "A cytoskeletal structure composed of actin filaments and myosin that forms beneath the plasma membrane of many cells, including animal cells and yeast cells, in a plane perpendicular to the axis of the spindle, i.e. the cell division plane. Ring contraction is associated with centripetal growth of the membrane that divides the cytoplasm of the two daughter cells. In animal cells, the contractile ring is located inside the plasma membrane at the location of the cleavage furrow. In budding fungal cells, e.g. mitotic S.

cerevisiae cells, the contractile ring forms beneath the plasma membrane at the mother-bud neck before mitosis." [GOC

Actin filaments are a major component of the contractile apparatus of skeletal muscle and the microfilaments of the cytoskeleton of eukaryotic cells. The filaments, comprising polymerized globular actin molecules, appear as flexible structures with a diameter of 5-9 nm. They are organized into a variety of linear bundles, two-dimensional networks, and three dimensional gels. In the cytoskeleton they are most highly concentrated in the cortex of the cell just beneath the plasma membrane." [GOC

3788 [Cluster 345]GO:0072559+C cellular\_component [name] NLRP3 inflammasome complex [def]  
"A protein complex that consists of three components, NLRP3 (NALP3), PYCARD and  
caspase-1. It is activated upon exposure to whole pathogens, as well as a number of  
structurally diverse pathogen- and danger-associated molecular patterns (PAMPs and DAMPs)  
and environmental irritants. Whole pathogens demonstrated to activate the NLRP3  
inflammasome complex include the fungi *Candida albicans* and *Saccharomyces cerevisiae*,  
bacteria that produce pore-forming toxins, including *Listeria monocytogenes* and  
*Staphylococcus aureus*, and viruses such as Sendai virus, adenovirus, and influenza  
virus." [GOC

3799 [Cluster 346]GO:0005749+C cellular\_component [name] mitochondrial respiratory chain  
complex II [def] "A protein complex located in the mitochondrial inner membrane that  
forms part of the mitochondrial respiratory chain. Contains the four polypeptide subunits  
of succinate dehydrogenase, flavin-adenine dinucleotide and iron-sulfur. Catalyzes the  
oxidation of succinate by ubiquinone. Connects the TCA cycle with the respiratory chain."

The mediator complex is required for activation of transcription of most protein-coding genes, but can also act as a transcriptional corepressor. The Saccharomyces complex contains several identifiable subcomplexes

4855 [Cluster 442]GO:0005856+C cellular\_component [name] cytoskeleton [def] "Any of the various filamentous elements that form the internal framework of cells, and typically remain after treatment of the cells with mild detergent to remove membrane constituents and soluble components of the cytoplasm. The term embraces intermediate filaments, microfilaments, microtubules, the microtrabecular lattice, and other structures characterized by a polymeric filamentous nature and long-range order within the cell. The various elements of the cytoskeleton not only serve in the maintenance of cellular shape but also have roles in other cellular functions, including cellular movement, cell division, endocytosis, and movement of organelles." 5075 [Cluster 462]GO:0005736+C cellular\_component [name] DNA-directed RNA polymerase I complex [def] "RNA polymerase I, one of three nuclear DNA-directed RNA polymerases found in all eukaryotes, is a multisubunit complex typically it produces rRNAs. Two large subunits comprise the most conserved portion including the catalytic site and share similarity with other eukaryotic and bacterial multisubunit RNA polymerases. The remainder of the complex is composed of smaller subunits (generally ten or more), some of which are also found in RNA polymerase III and others of which are also found in RNA polymerases II and III. Although the core is competent to mediate ribonucleic acid synthesis, it requires additional factors to select the appropriate template." [GOC

5097 [Cluster 464]GO:0005814+C cellular\_component [name] centriole [def] "A cellular organelle, found close to the nucleus in many eukaryotic cells, consisting of a small cylinder with microtubular walls, 300-500 nm long and 150-250 nm in diameter. It contains nine short, parallel, peripheral microtubular fibrils, each fibril consisting of one complete microtubule fused to two incomplete microtubules. Cells usually have two centrioles, lying at right angles to each other. At division, each pair of centrioles generates another pair and the twin pairs form the pole of the mitotic spindle." [ISBN
