30276 [Cluster 2753]GO:0010332+P biological\_process [name] response to gamma radiation [def] "Any process that results in a change in state or activity of a cell or an organism (in terms of movement, secretion, enzyme production, gene expression, etc.) as a result of a gamma radiation stimulus. Gamma radiation is a form of electromagnetic radiation (EMR) or light emission of a specific frequency produced from sub-atomic particle interaction, such as electron-positron annihilation and radioactive decay. Gamma rays are generally characterized as EMR having the highest frequency and energy, and also the shortest wavelength, within the electromagnetic radiation spectrum." [GOC

752 [Cluster 69]GO:0071889+F molecular\_function [name] 14-3-3 protein binding [def] "Interacting selectively and non-covalently with a 14-3-3 protein. A 14-3-3 protein is any of a large family of approximately 30kDa acidic proteins which exist primarily as homo- and heterodimers within all eukaryotic cells, and have been implicated in the modulation of distinct biological processes by binding to specific phosphorylated sites on diverse target proteins, thereby forcing conformational changes or influencing interactions between their targets and other molecules. Each 14-3-3 protein sequence can be roughly divided into three sections

2578 [Cluster 235]GO:0050700+F molecular\_function [name] CARD domain binding [def] "Interacting selectively and non-covalently with a CARD (N-terminal caspase recruitment) domain, a protein-protein interaction domain that belongs to the death domain-fold superfamily. These protein molecule families are similar in structure with each consisting of six or seven anti-parallel alpha-helices that form highly specific homophilic interactions between signaling partners. CARD exists in the N-terminal prodomains of several caspases and in apoptosis-regulatory proteins and mediates the assembly of CARD-containing proteins that participate in activation or suppression of CARD carrying members of the caspase family." 4228 [Cluster 385]GO:0051400+F molecular\_function [name] BH domain binding [def]  
"Interacting selectively and non-covalently with the Bcl-2 homology (BH) domain of a  
protein. Bcl-2-related proteins share homology in one to four conserved regions  
designated the Bcl-2 homology (BH) domains BH1, BH2, BH3 and BH4. These domains  
contribute at multiple levels to the function of these proteins in cell death and  
survival. Anti-apoptotic members of the Bcl-2 family have four BH domains (BH1-BH4).  
Pro-apoptotic members have fewer BH domains." [PMID

4921 [Cluster 448]GO:0048037+F molecular\_function [name] cofactor binding [def] "Interacting selectively and non-covalently with a cofactor, a substance that is required for the activity of an enzyme or other protein. Cofactors may be inorganic, such as the metal atoms zinc, iron, and copper in certain forms, or organic, in which case they are referred to as coenzymes. Cofactors may either be bound tightly to active sites or bind loosely with the substrate." [ISBN
