

Supplementary Figure S4. Sequence analysis of cap-124/9 viruses recovered from the brain of morbid SCID mice.

SCID mice (n = 5) were infected IP with 10^5 pfu/mouse. Mice succumbed to encephalitis between dpi 26-31. Brains from paralyzed mice were collected and used for viral isolation and sequencing analysis. Red double arrows schematically indicate the location of deleted sequences in the cap-124/9 genome.
