

Supplementary Fig. S1 Effects of AGEs on eNOS protein levels and NOS activity in HCAECs. Western blot analysis. Cells were treated with 100ug/l AGEs for 24 h. Representative bands of p-eNOS (SER1177) and β-actin staining and quantitation of band density ratios. Full-length blots are presented. * $P < 0.05$ compare with control, $n = 3$ experiments. Data are means and SE of multiple experiments (n).
