Supplementary Fig. S1. (A) Event-free survival (EFS) according to presence of minimal residual disease (MRD) at end of remission induction: MRD (-) 91.1±3.8% (51/56), MRD (+) 33.3±19.2% (2/6). (B) EFS according to presence of additional 12p structural abnormalities (translocations or inversions): without additional 12p structural abnormalities 87.7±4.3% (50/57), with additional 12p structural abnormalities 50.0±20.4% (3/6).

Supplementary Table 1. Risk group classification of ALL

Risk group	Criteria
Low	All of the following: Age ≥ 1 and < 10 years old Initial WBC count < 50,000 /mm ³ Trisomies of 4, 10, 17 or <i>ETV6/RUNX1</i> (+)
Standard	As above, except lack of trisomies of 4, 10, 17 or <i>ETV6/RUNX1</i> (+)
High	Any of the following: Age ≥ 10 and < 15 years old Initial WBC count ≥ 50,000 /mm ³ and < 100,000 /mm ³ Initial CNS or testicular involvement Precursor B cell ALL with poor prephase steroid response ^a <i>E2A/PBX1</i> (+) <i>MLL</i> rearrangement MRD (+) at end of remission induction T cell ALL with good prephase steroid response
Very high	Any of the following: Age ≥ 15 years old Initial WBC count ≥ 100,000 /mm ³ <i>BCR/ABL1</i> (+) ALL Infant ALL Hypodiploidy with < 45 chromosomes T cell ALL with poor prephase steroid response CR not achieved after first remission induction

ALL, acute lymphoblastic leukemia; WBC, white blood cell; CNS, central nervous system; MRD, minimal residual disease; CR, complete remission. ^aPoor prephase steroid response indicates a peripheral blast count ≥ 1,000 /mm³ after 7 days of steroid treatment.
