

Supplemental Material

Supplemental Figure 1. Event rate for CRT-D patients by binned PR interval. A plot of the unadjusted incidence of heart failure hospitalization or death among CRT-D patients divided into subgroups based on PR interval using 10ms bins. The plot was fit with a linear spline function with a single knot at 170ms.

Supplemental Figure 2. The unadjusted and adjusted associations between PR interval (across the continuous range) and outcomes among CRT-D patients. Unadjusted and adjusted restricted cubic splines (with 5 knots at 5th, 25th, 50th, 75th, and 90th percentiles) depicting the association between PR interval and (log hazard) risk for HF hospitalization or death (**a**, unadjusted; **b**, adjusted), death (**c**, unadjusted; **d**, adjusted) and HF hospitalization (**e**, unadjusted; **f**, adjusted).

Supplemental Table 1. The baseline characteristics of the inverse probability weighted patient groups used for the primary comparative effectiveness analysis.
