

Supplementary Materials

When more is less: emergent suppressive interactions in three-drug combinations

Casey Beppler, Elif Tekin, Cynthia White, Zhiyuan Mao, Jeffrey H. Miller, Robert Damoiseaux, Van M. Savage, and Pamela J. Yeh

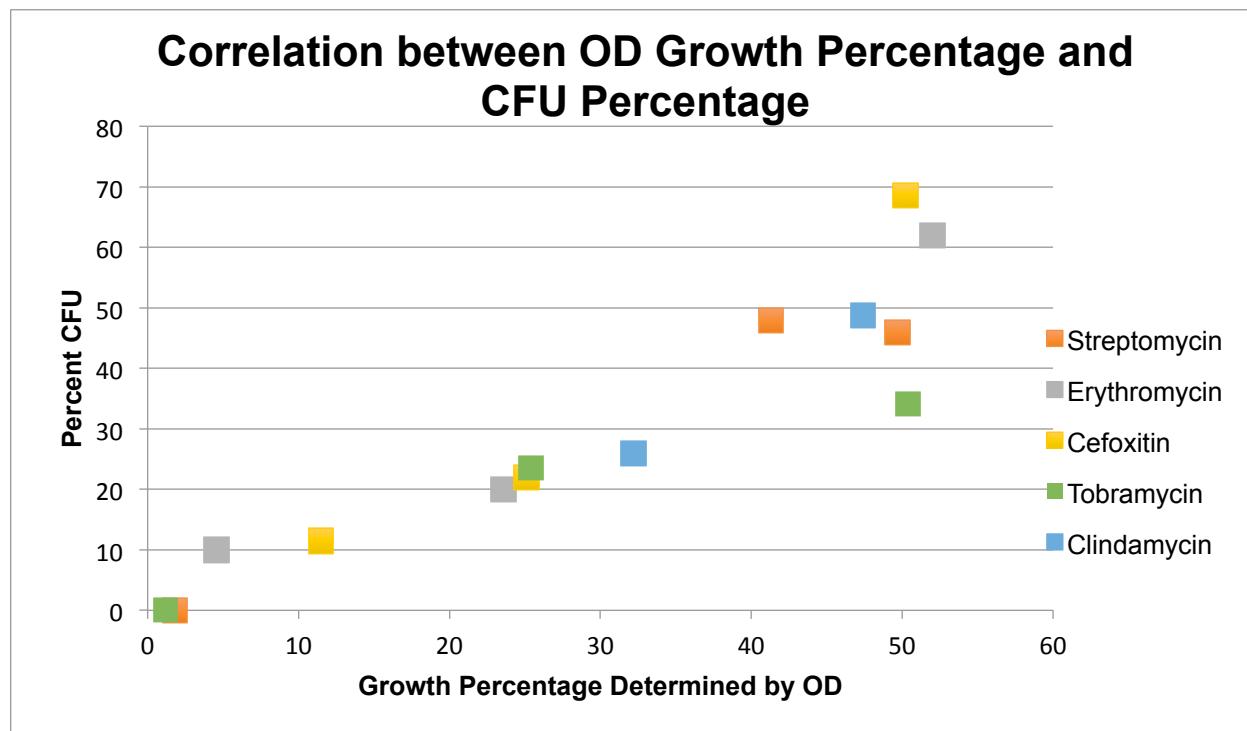

Supplementary Figure 1. Comparison of relative optical density measurement to growth rate measurement.

We performed experiments using 0.5, 0.75, 1, 1.25, 1.5 and 1.75 µg/ml streptomycin in *E. coli* BW25113 and measured growth relative to the no-drug control every hour to determine the growth rate, i.e. the slope. We compared this with the result of OD₆₀₀ measurement (relative to no-drug controls) at a single time point (18 hours). We found a correlation of r=0.74 and P < 0.00001.

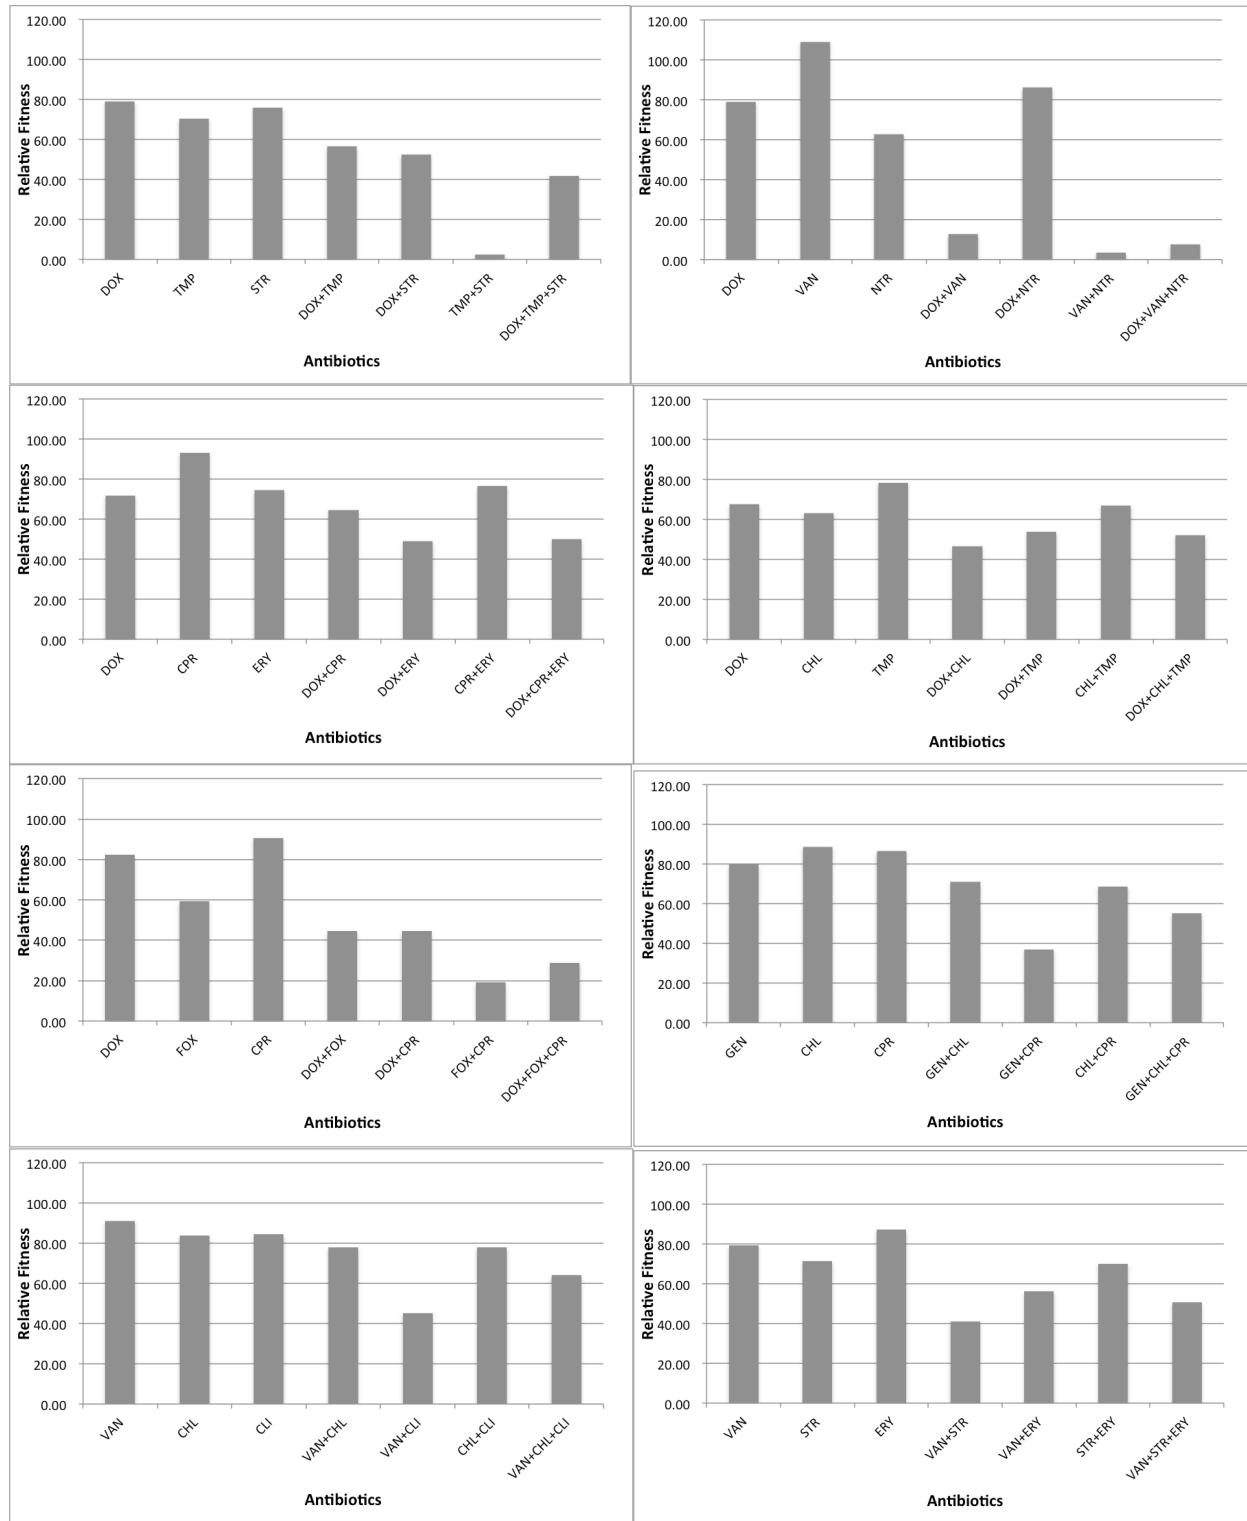

Supplementary Figure 2. Comparison of relative optical density measurement to colony forming units.

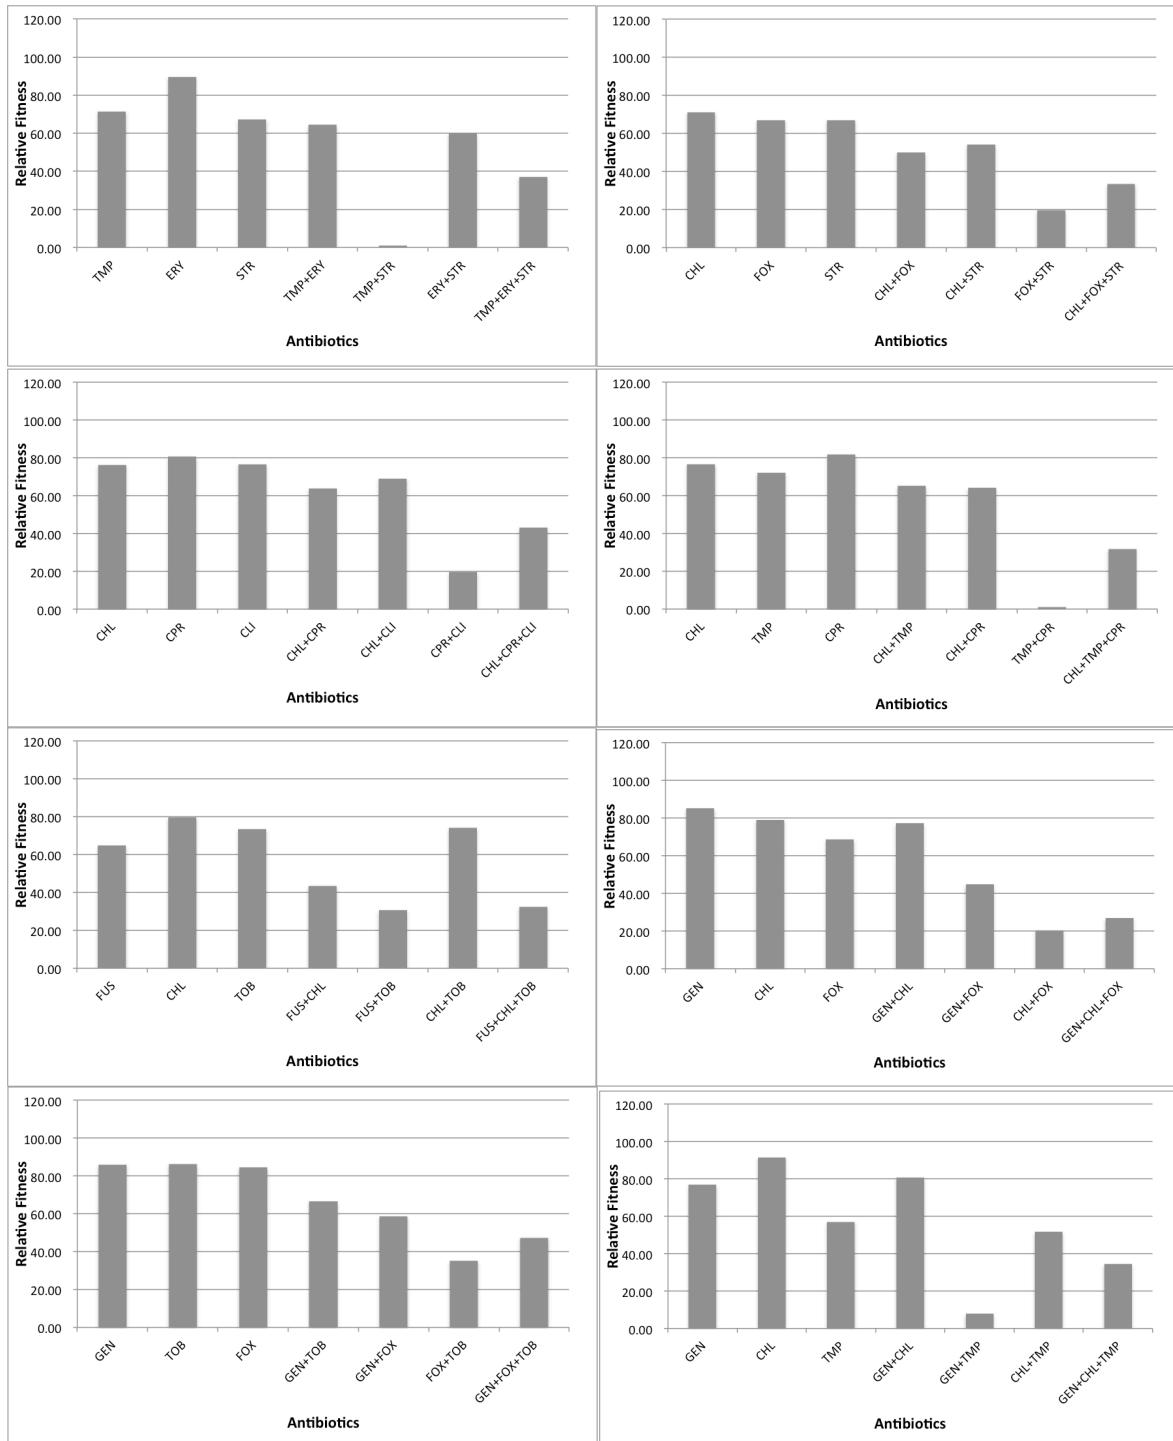

We performed experiments in *E. coli* BW25113 using streptomycin, erythromycin, cefoxitin, tobramycin, and clindamycin with 2-3 different concentrations per drug to compare counts based on colony forming units vs. OD₆₀₀ measurement at 18 hours (relative to no-drug controls). The concentrations (in µg/ml) were as follows: streptomycin 4.1, 5.7, and 11; erythromycin 75 and 121; cefoxitin 1.5, 2.9, and 9; clindamycin 60 and 75; and tobramycin 6, 4.8, and 3.8. This comparison yielded a correlation rate of 93% (n=14, P < 0.0001).

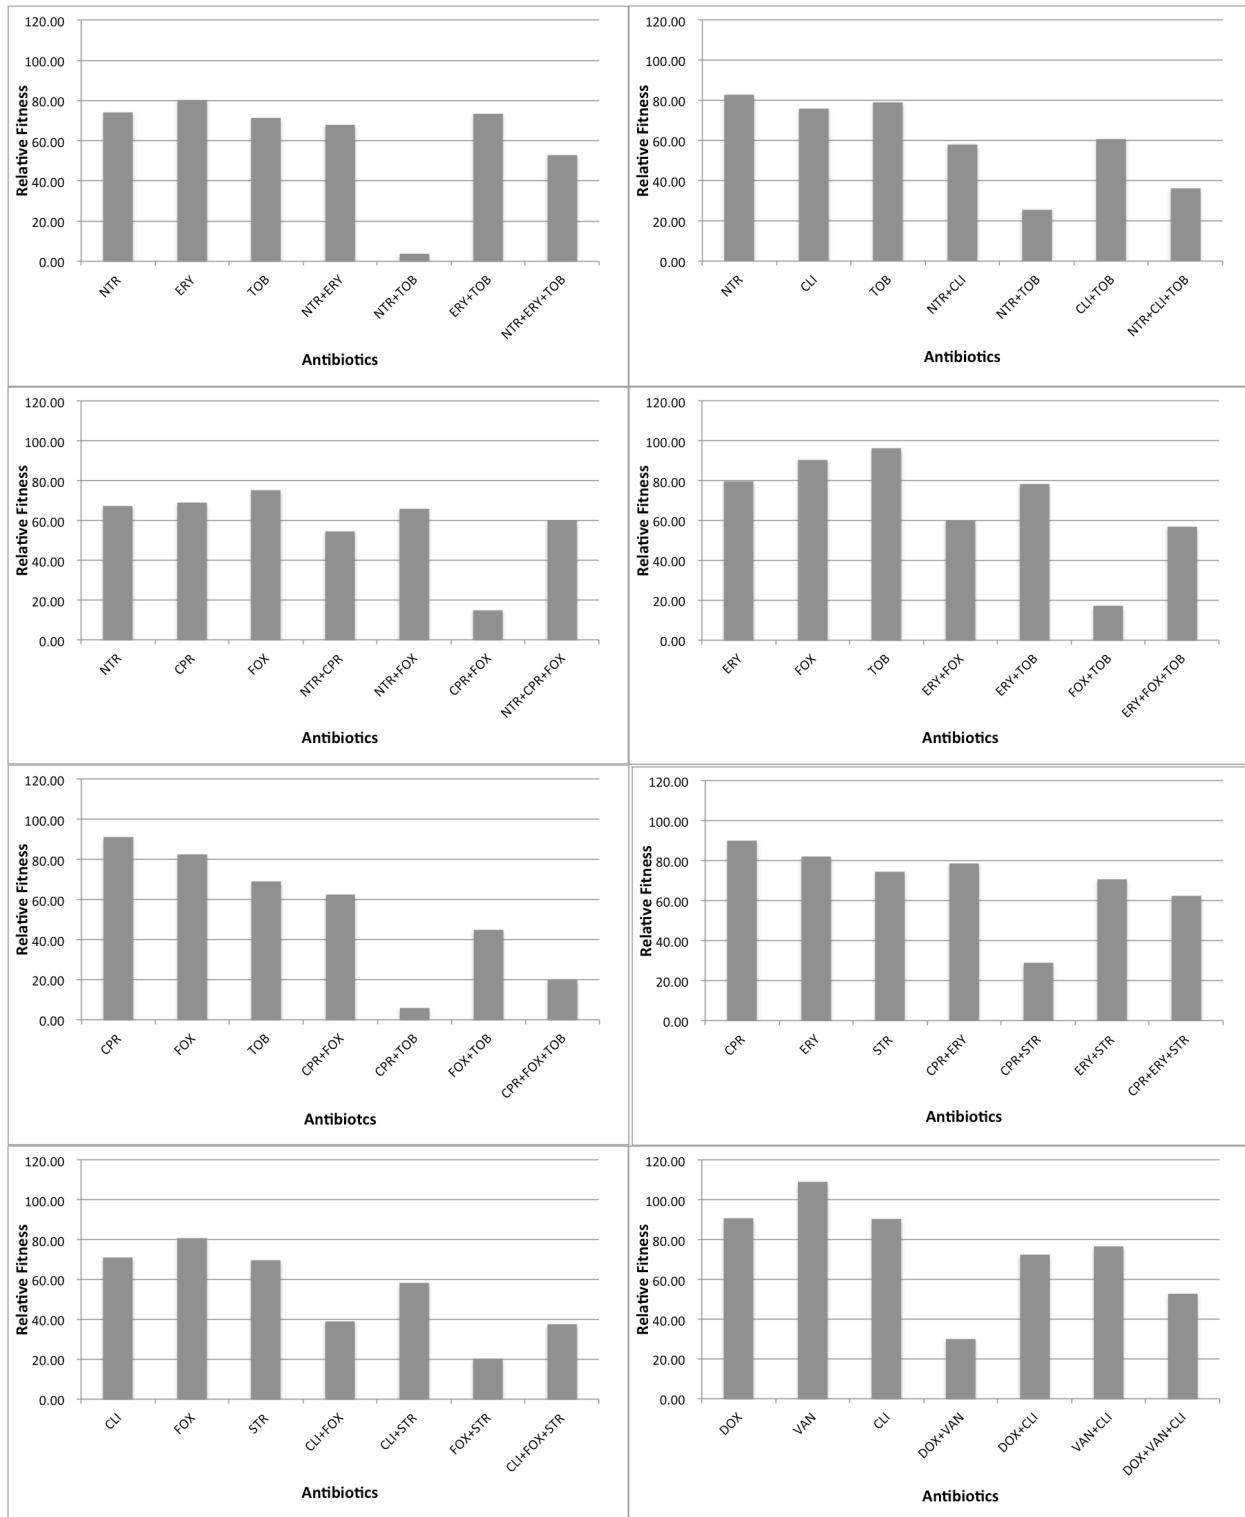

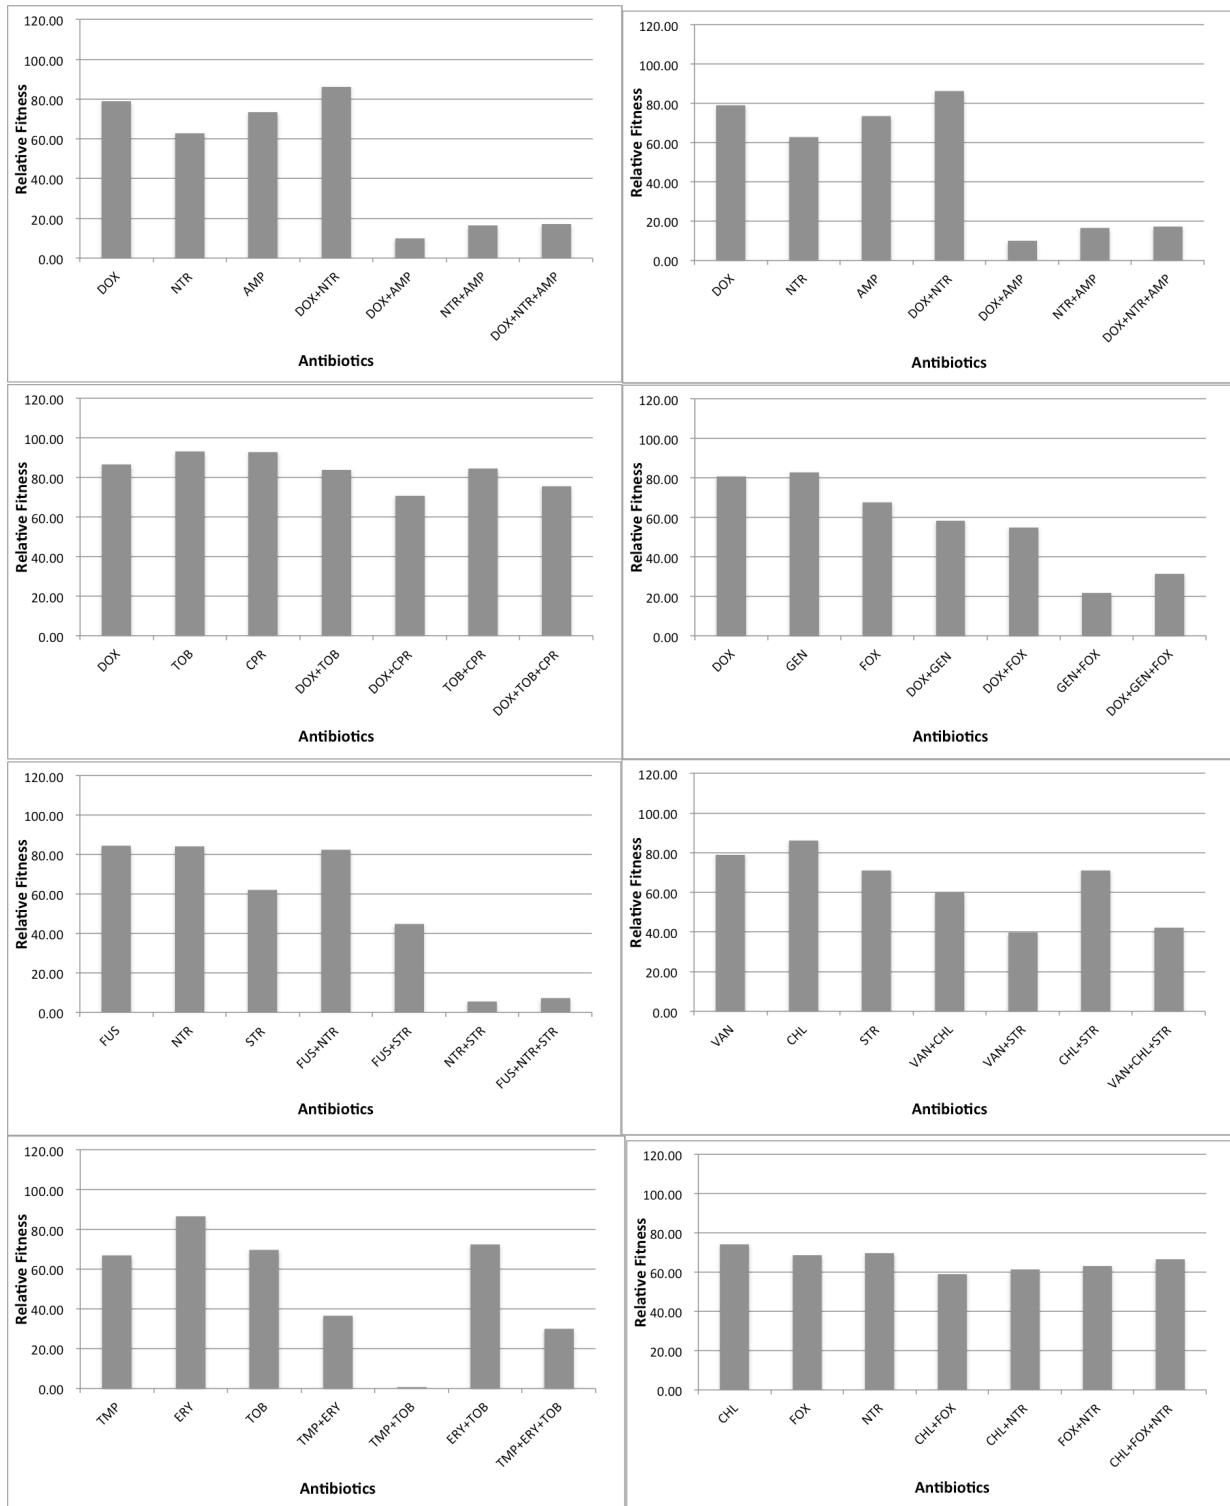

Supplementary Figure 3. Emergent three-way interaction measures in *E. coli* BW25113.

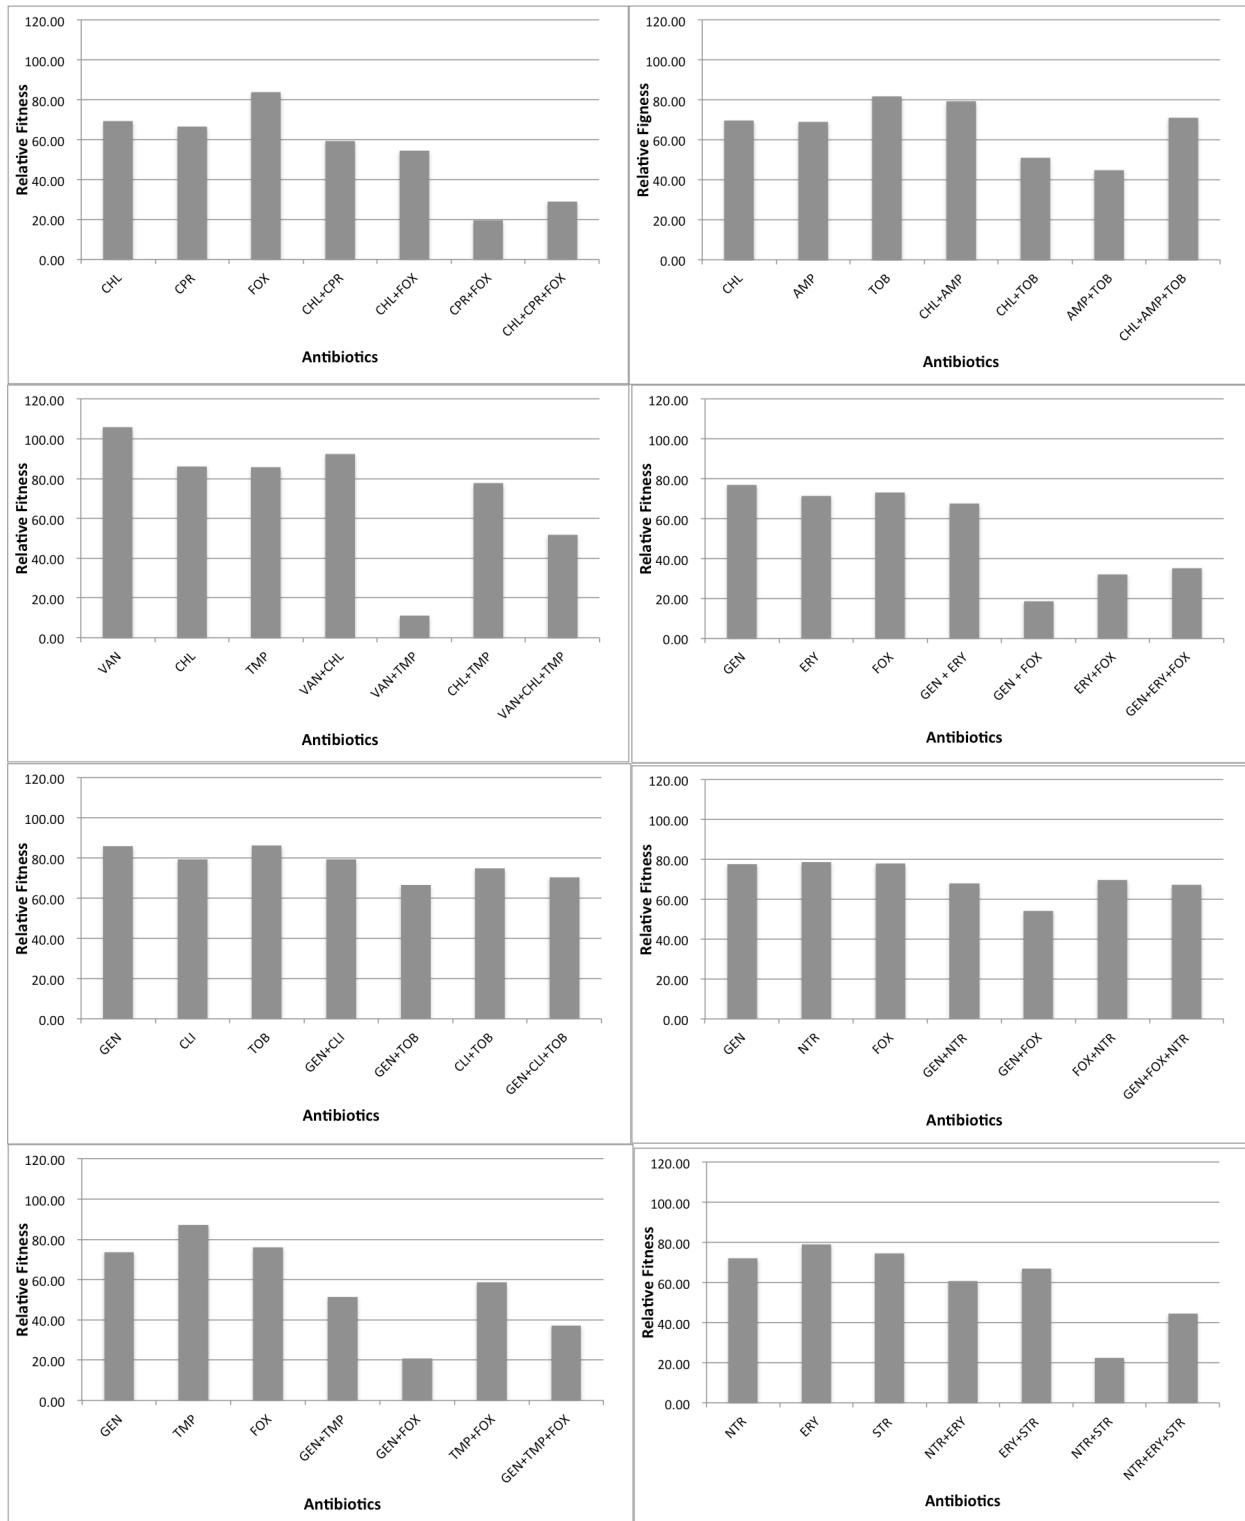

All 46 three-drug suppressive combinations showing growth percentage in different drug environments: all three single drugs, all two-drug combinations, and the single three-drug combination. X-axis indicates the drug environment, and Y-axis indicates the growth rate relative to bacteria grown in no-drug environment. In a few of the cases, we find multiple levels of suppression in a single three-drug combination: two drugs are suppressing one or both drugs when examining pairwise and single drug effects, and three drugs suppress one of the two-drug pairs when examining higher-order effects. For example, in the experiments involving DOX, NTR, and AMP, DOX-NTR suppresses both DOX by itself and NTR by itself, and DOX-NTR-AMP suppresses DOX-AMP. We found no cases where the two-drug suppressive combination was the one being suppressed in the three-drug suppressive combination.

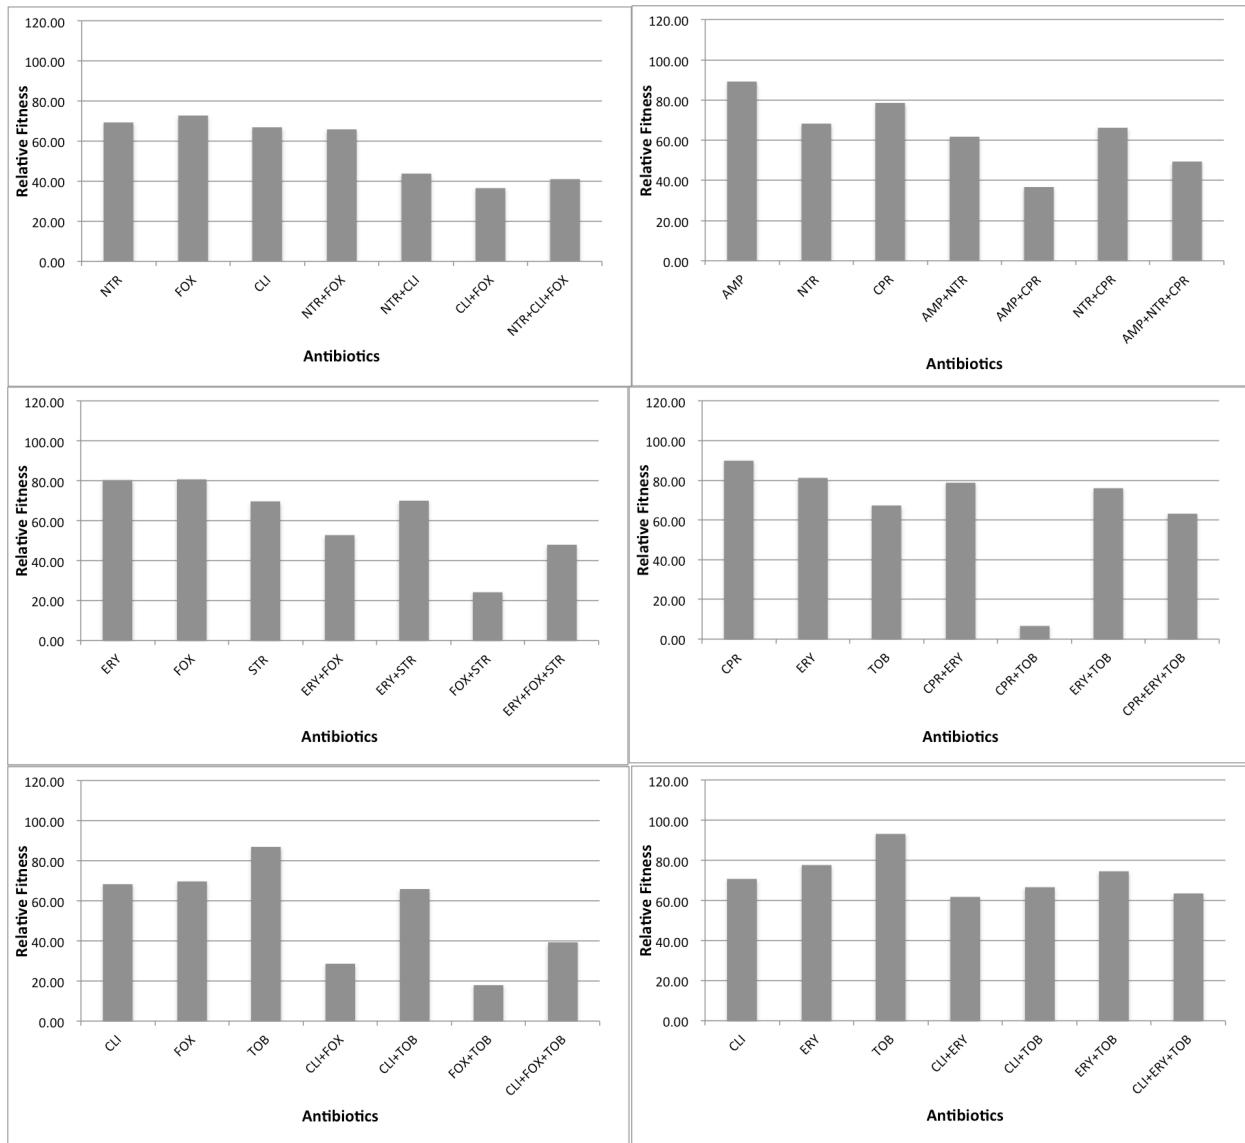

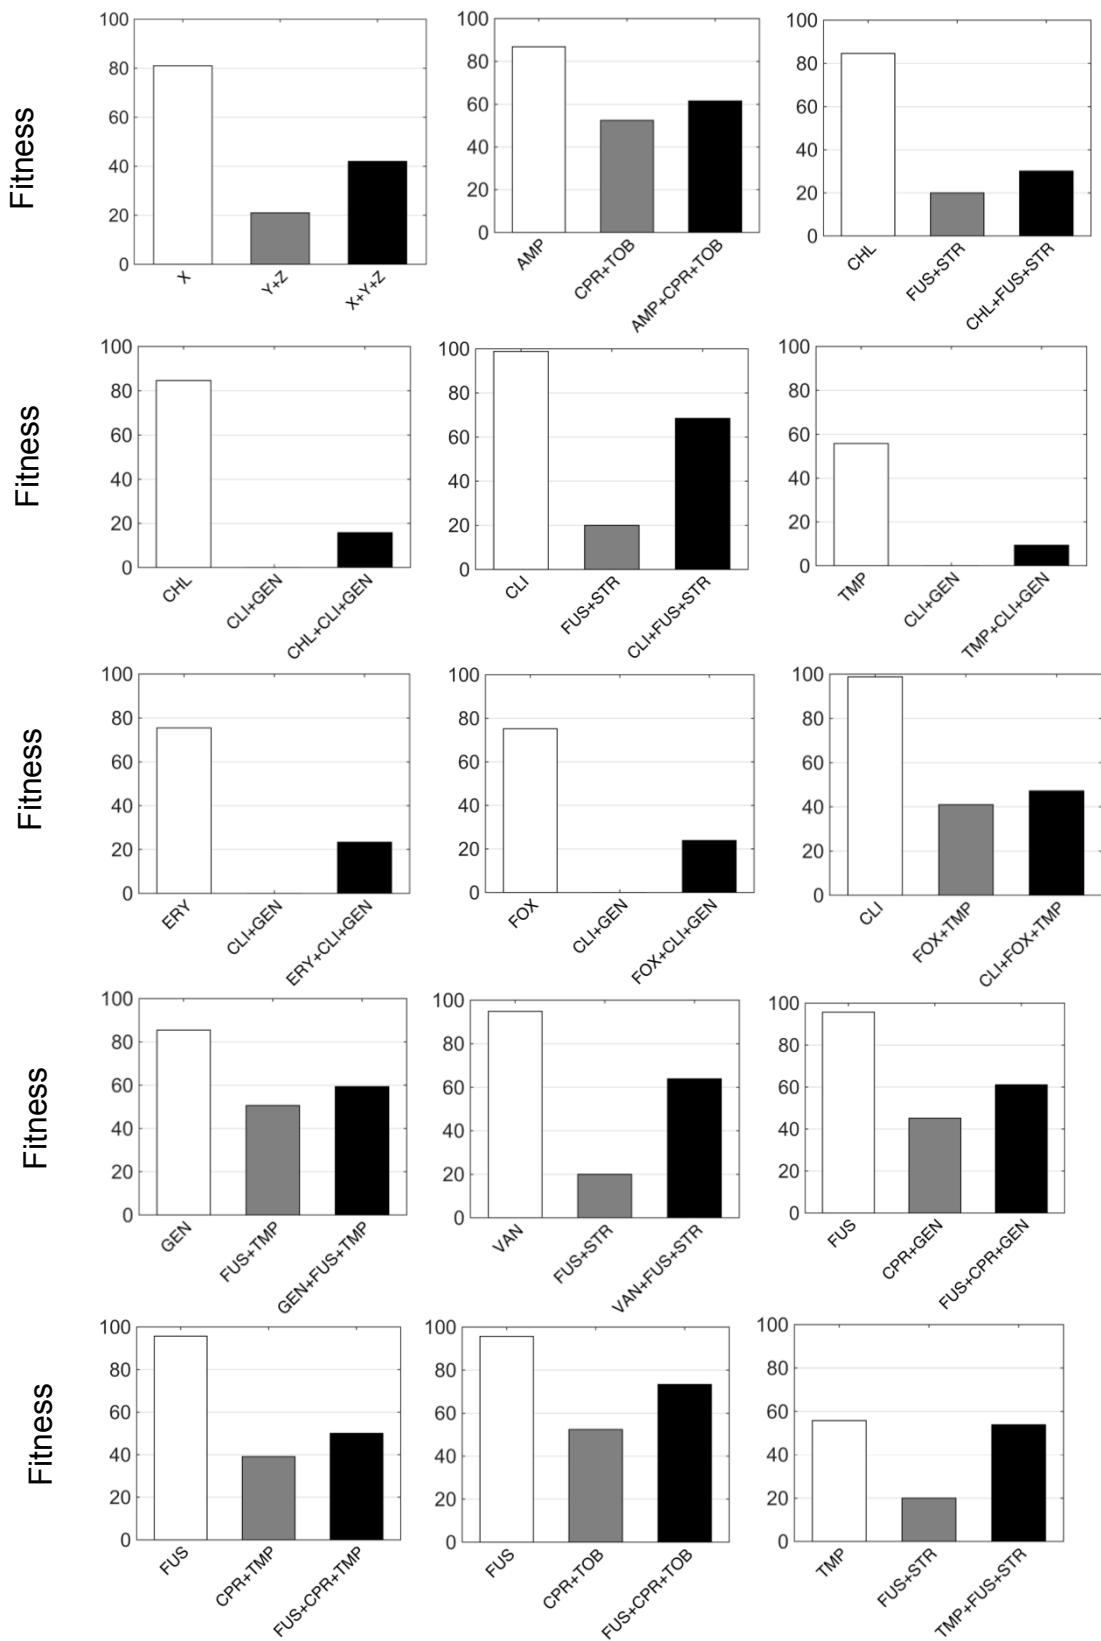

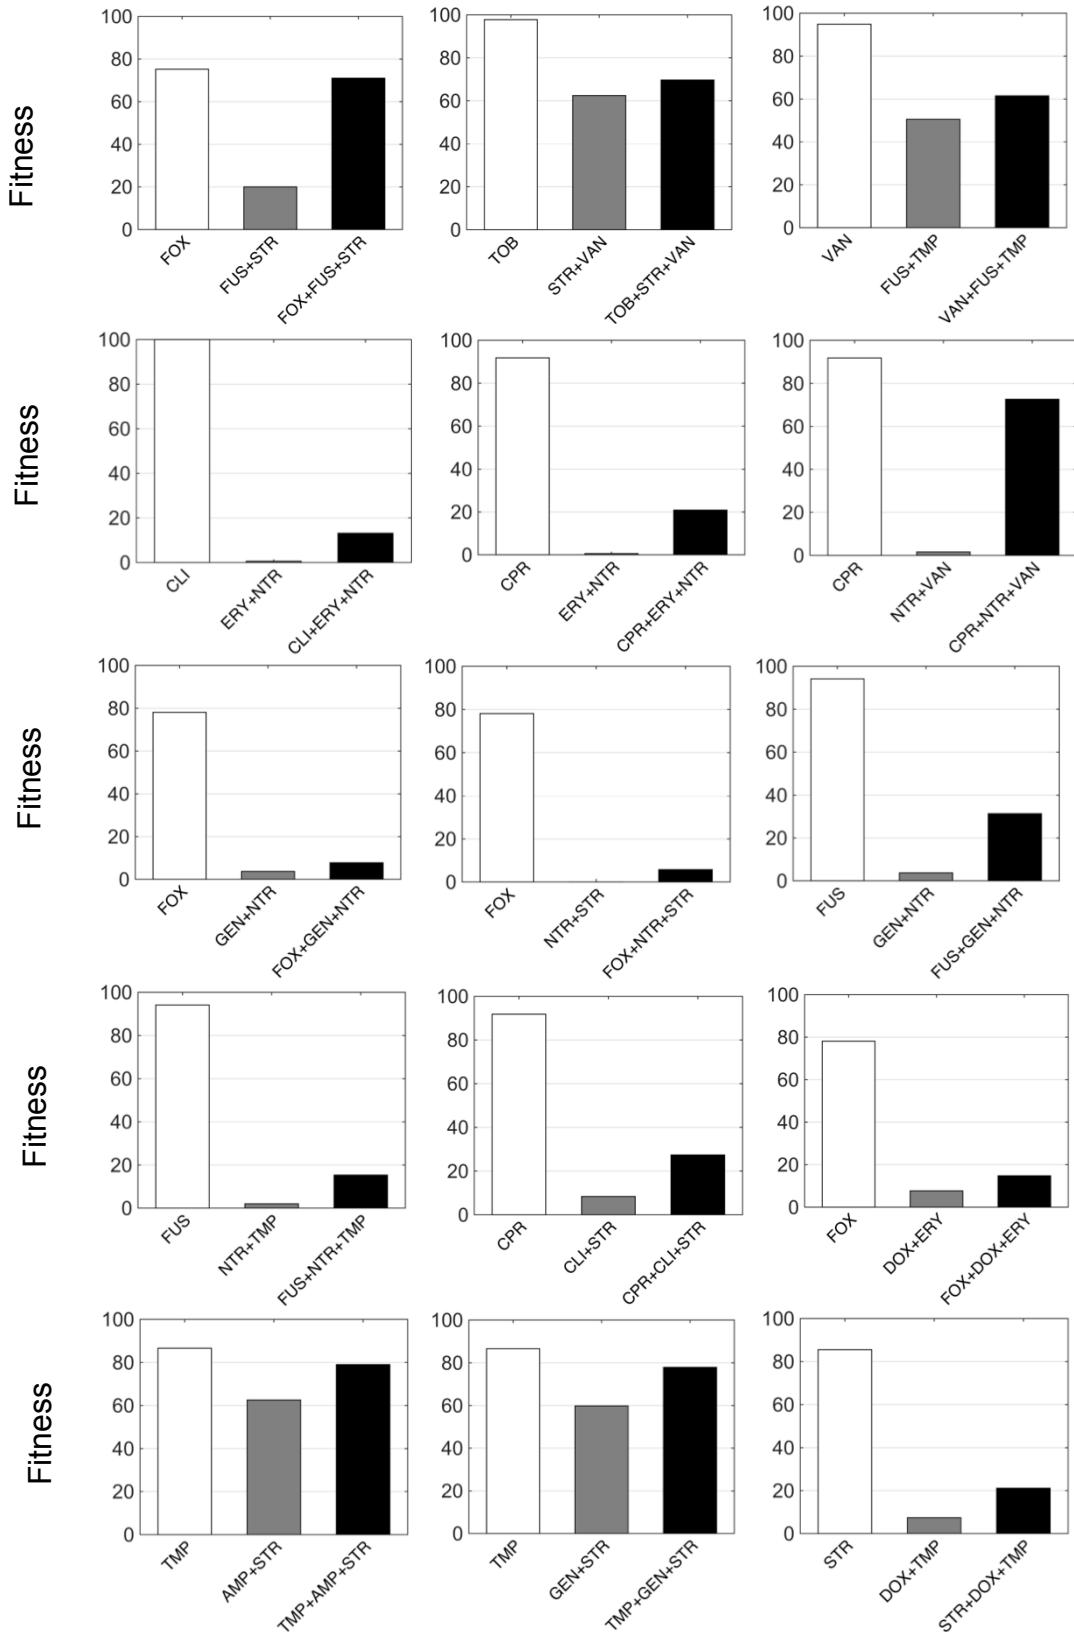

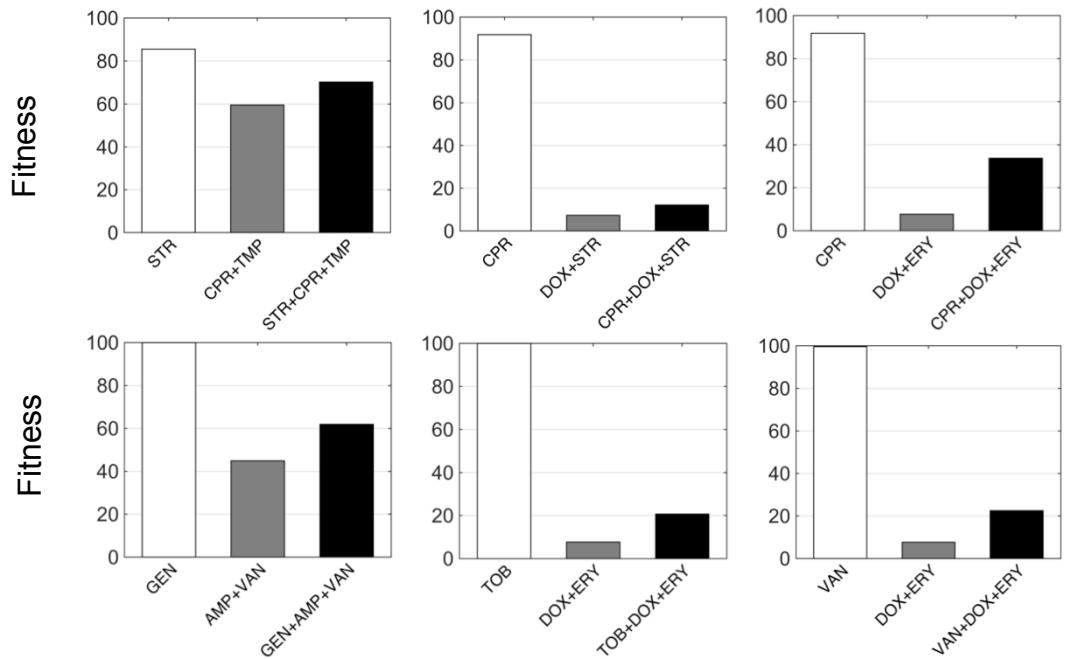

Supplementary Figure 4. Suppressive three-drug interactions in *S. epidermidis* 14990 and *E. coli* CFT073. Growth measurements are shown for bacteria in single-drug, two-drug, or three-drug conditions relative to the no-drug control (100% growth, not shown). Emergent suppression was determined following Tekin et al. (Tekin et al., 2016) (see Methods). The upper left figure is a schematic with X, Y, and Z representing three different drugs. Only the experimental data for the three-drug combination (X+Y+Z), the suppressed pairwise drug combination with the lower growth (Y+Z), and the suppressor single drug (X) is shown for simplicity. In *S. epidermidis* 14990, 35 triple combinations of a total 313 interaction measures were determined to be suppressive. In *E. coli* CFT073, 88 triple combinations of a total 356 interaction measures were determined to be suppressive. Antibiotic abbreviations are as listed in Table 1.

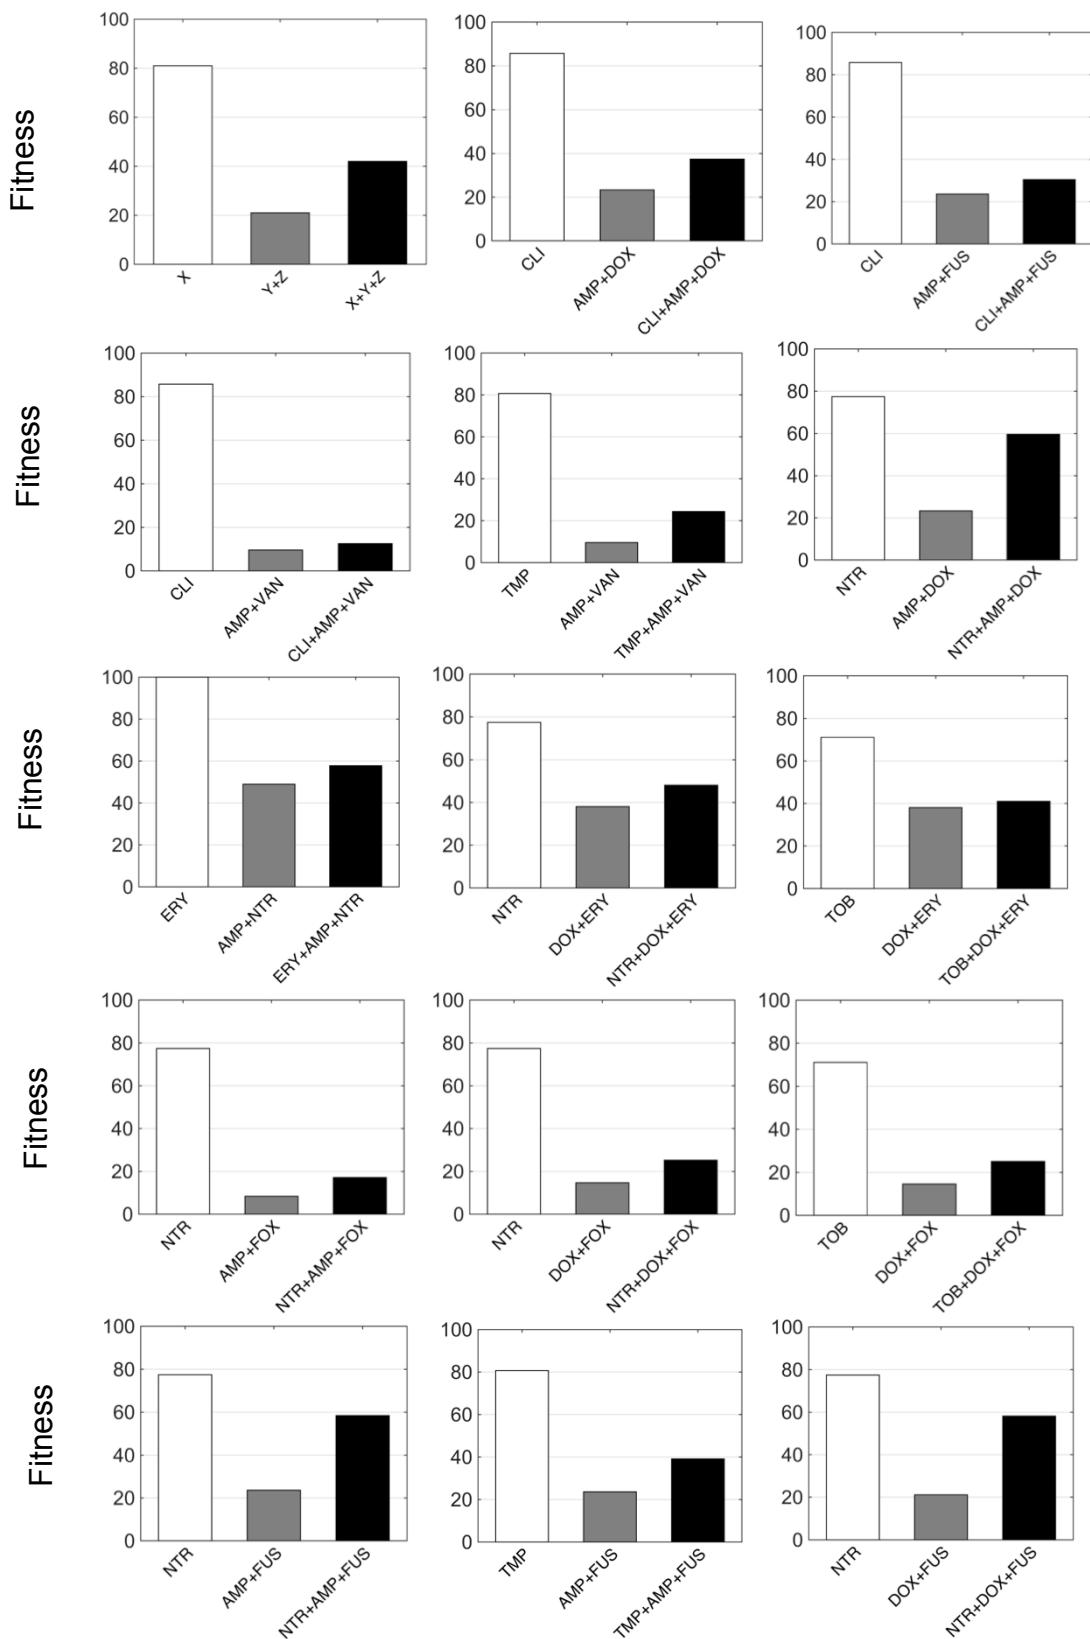

S. epidermidis 14990

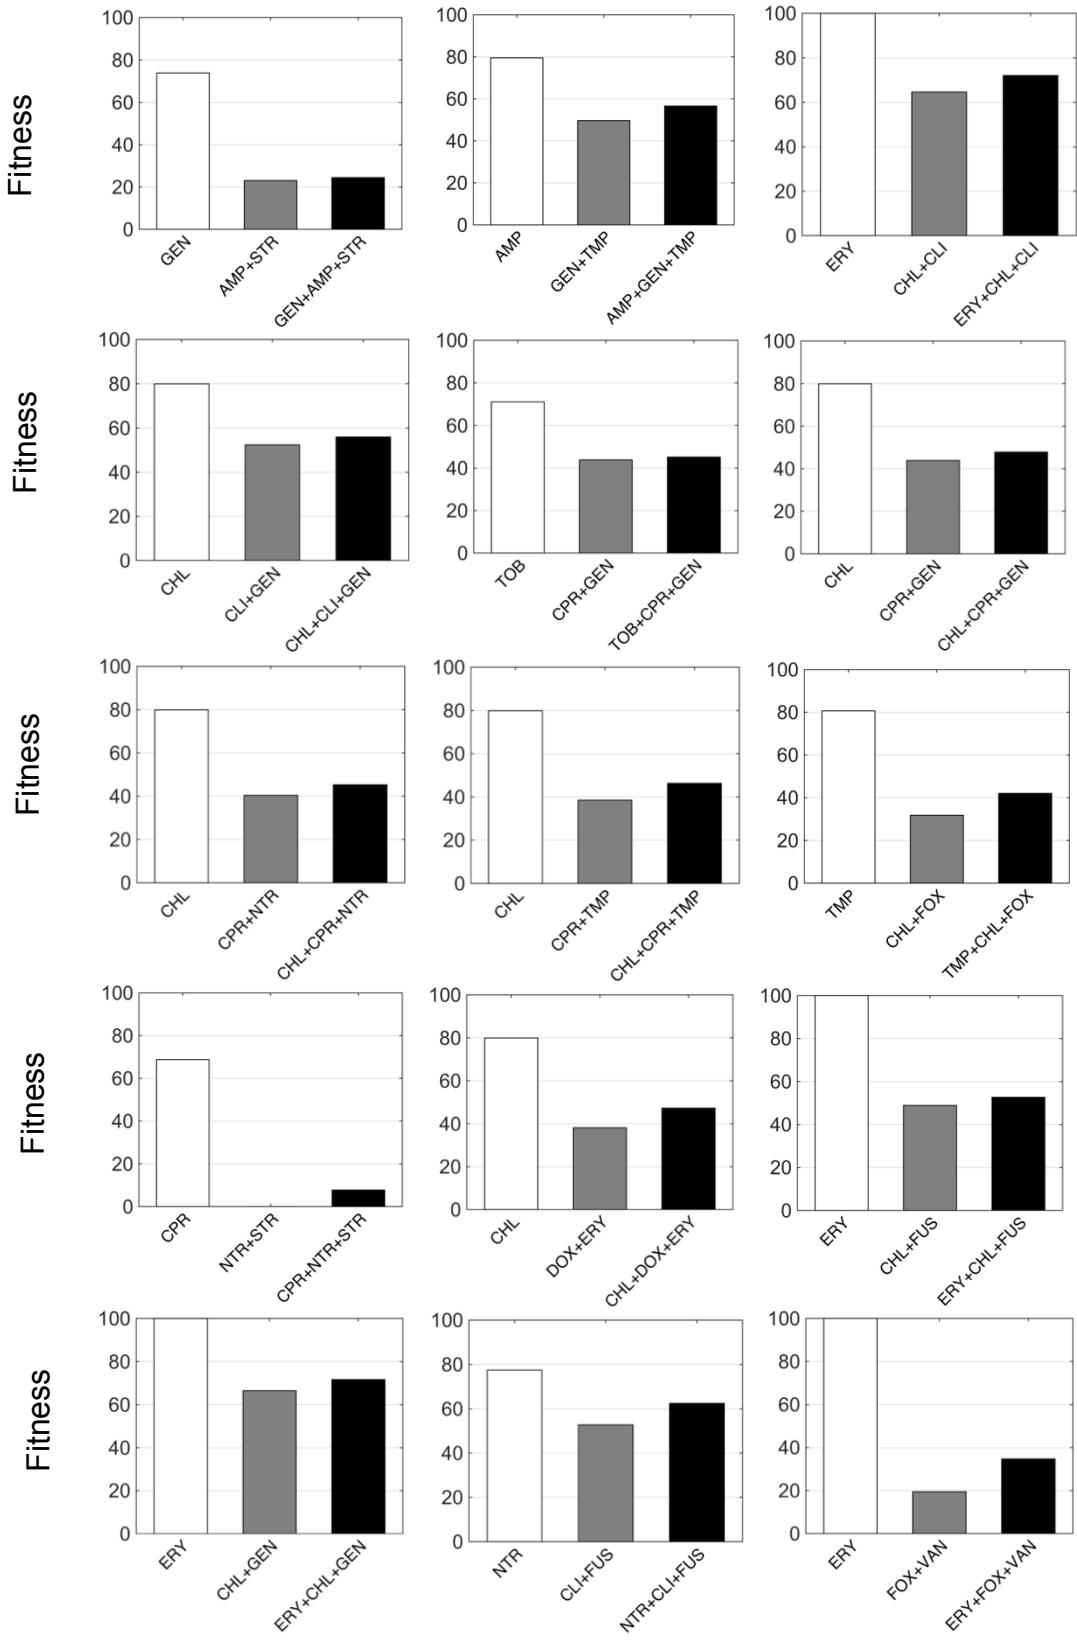

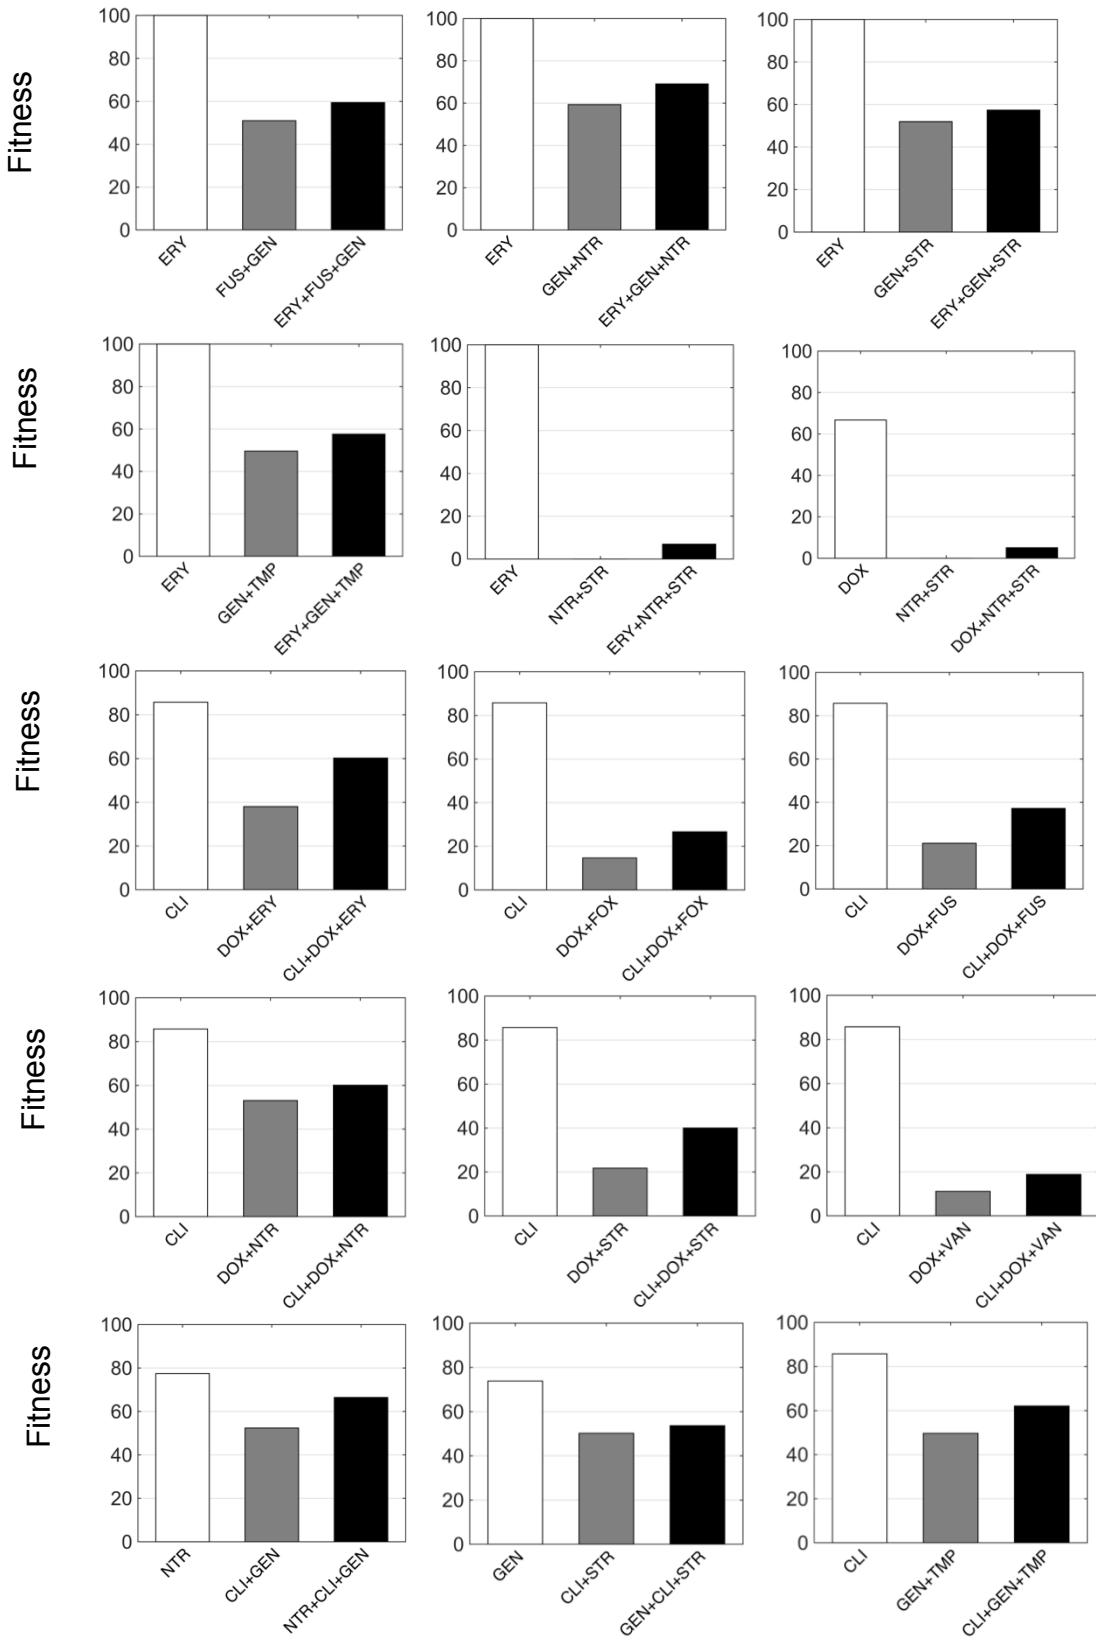

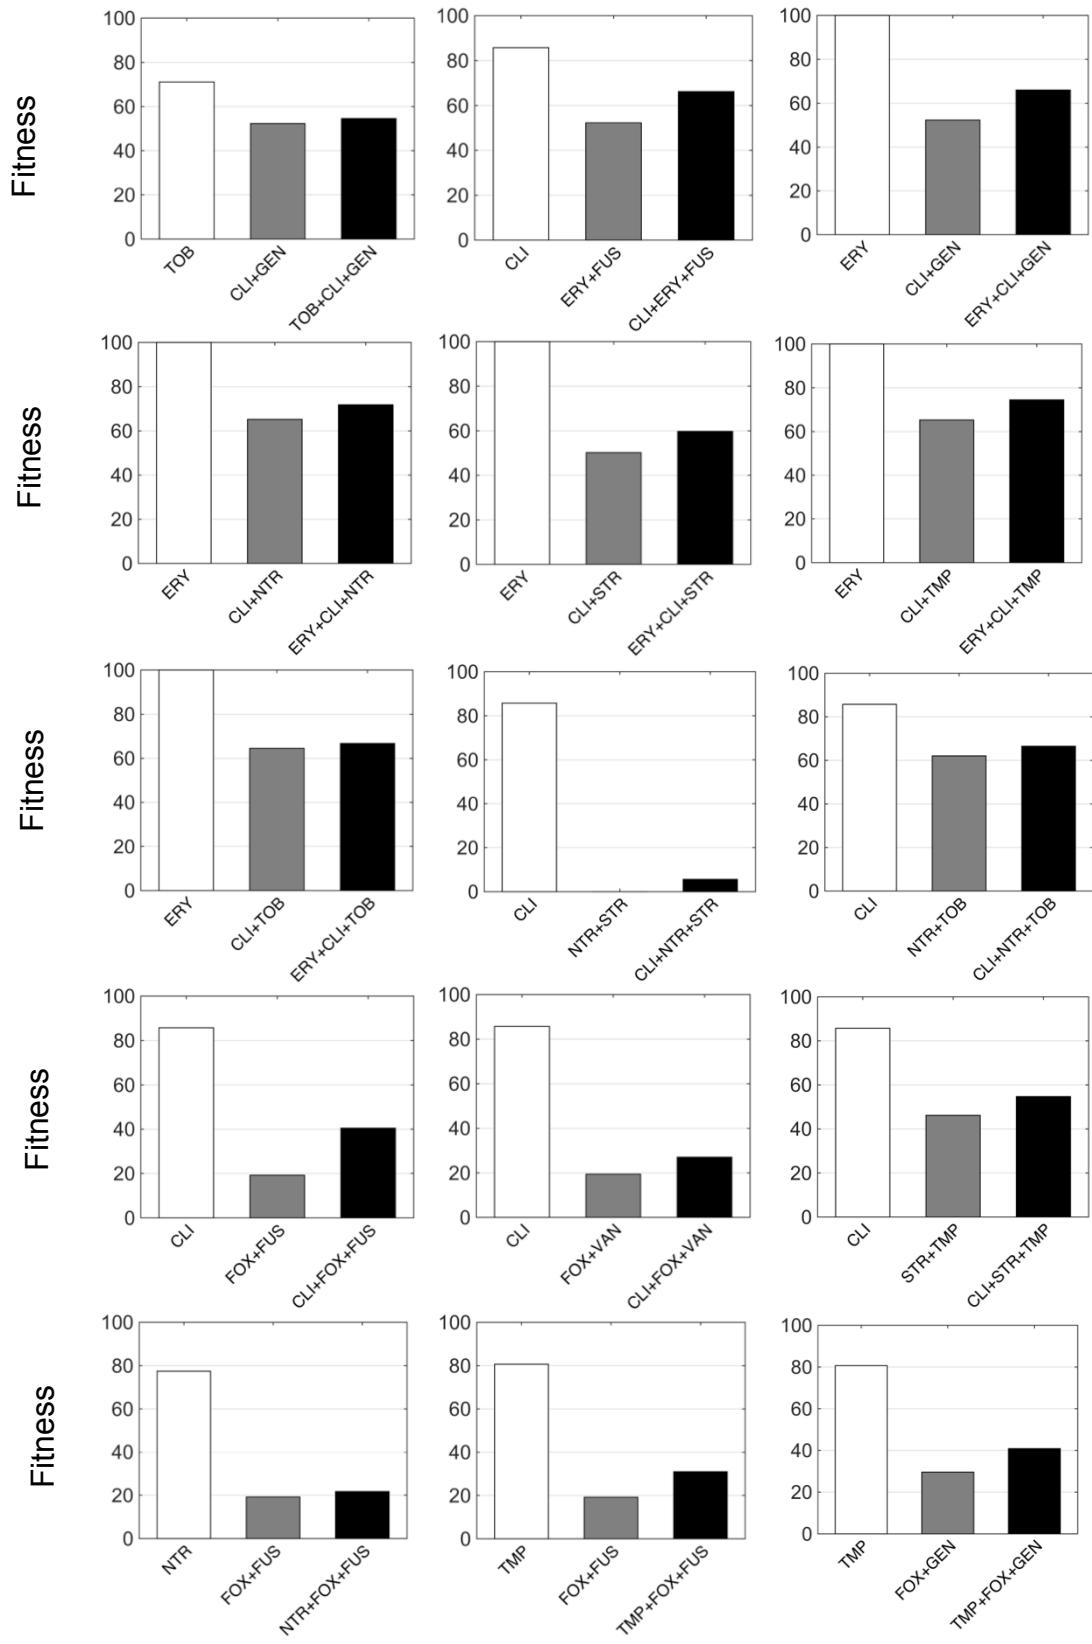

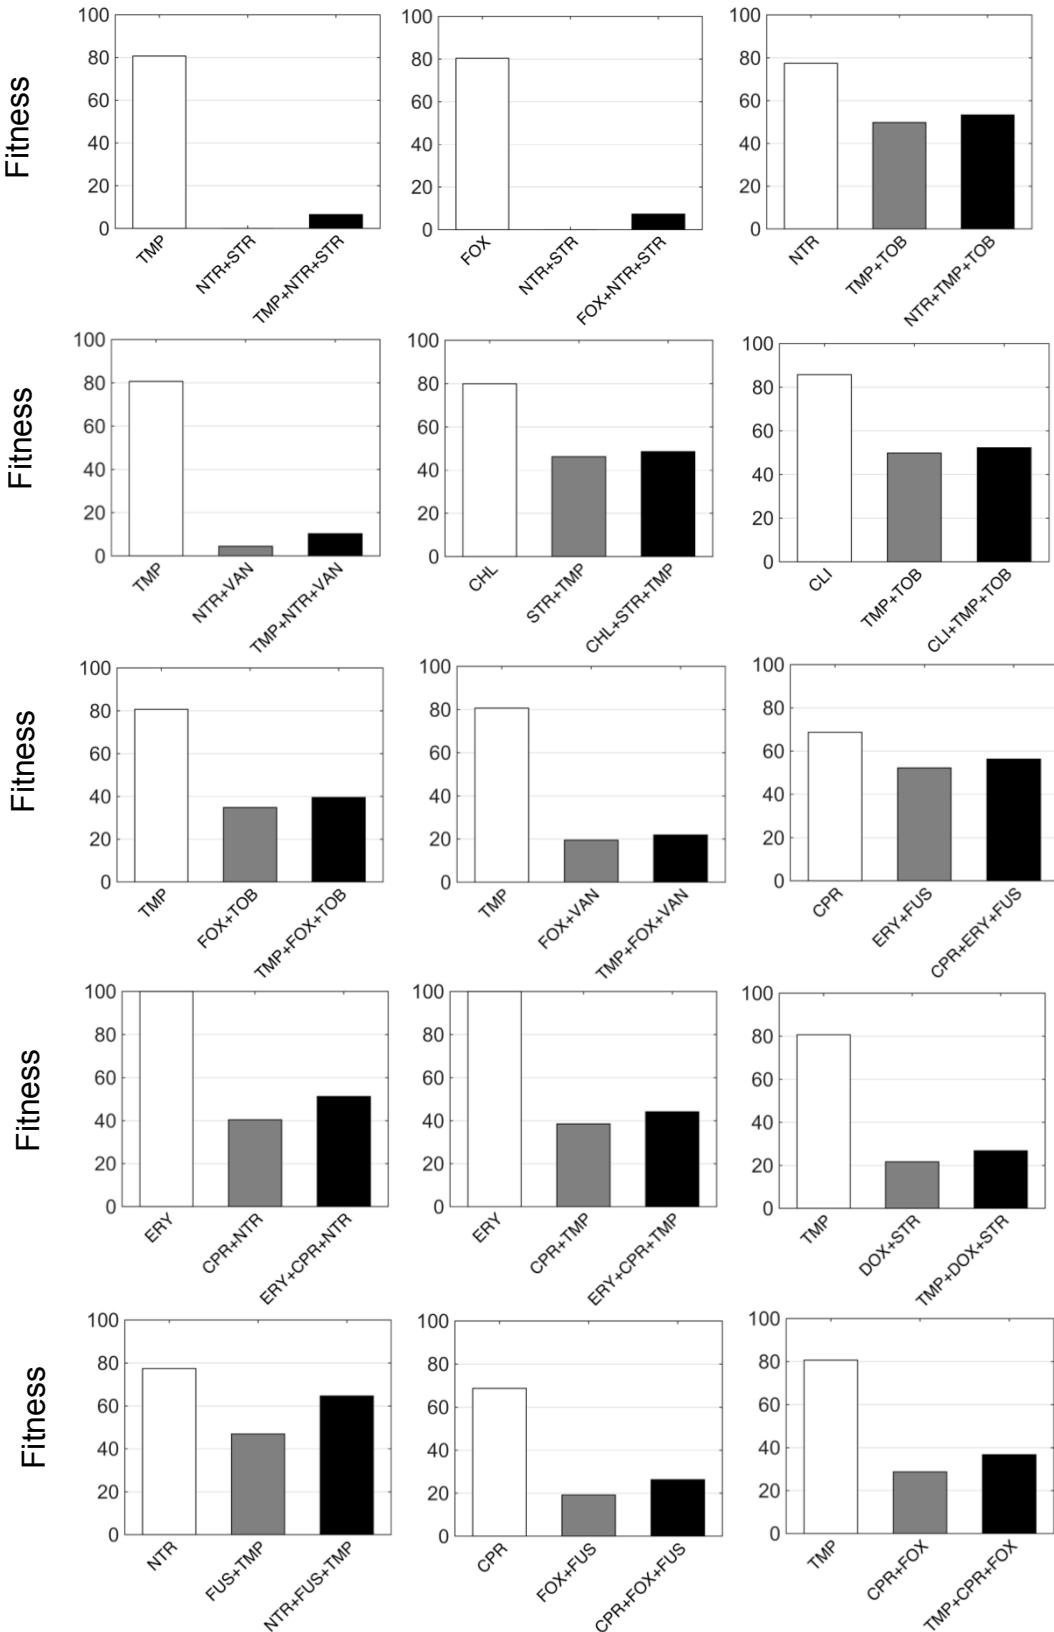

E. coli CTF073

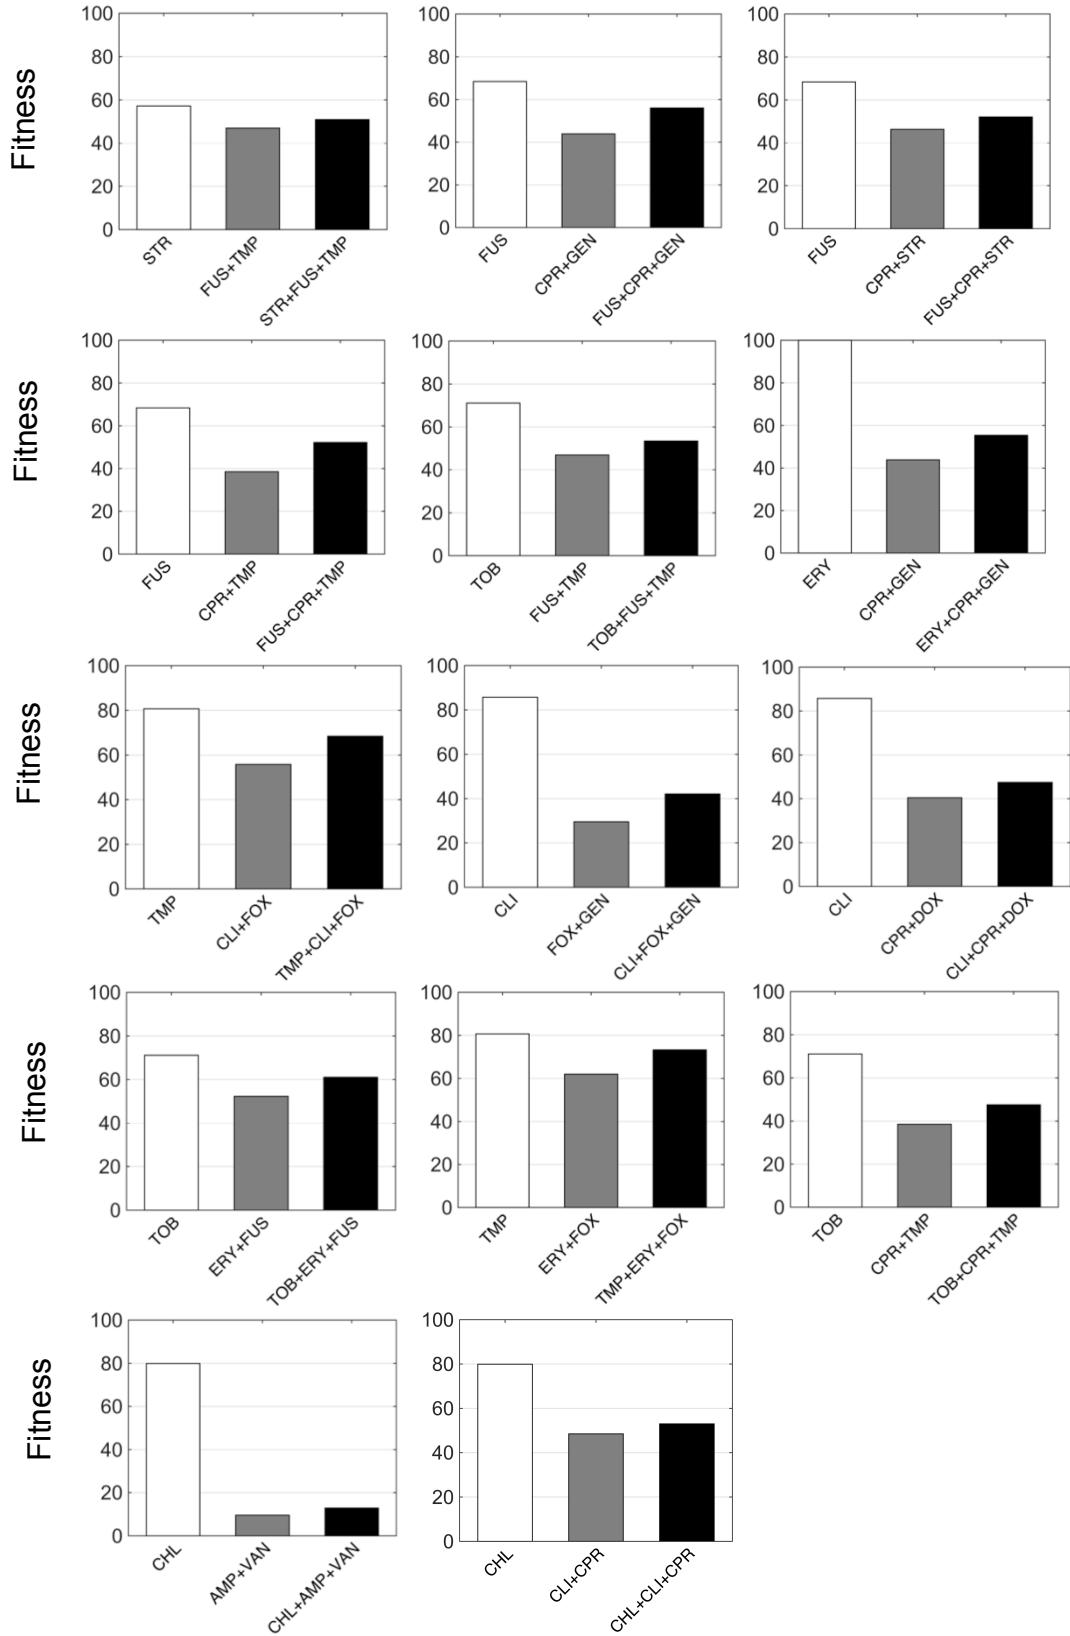

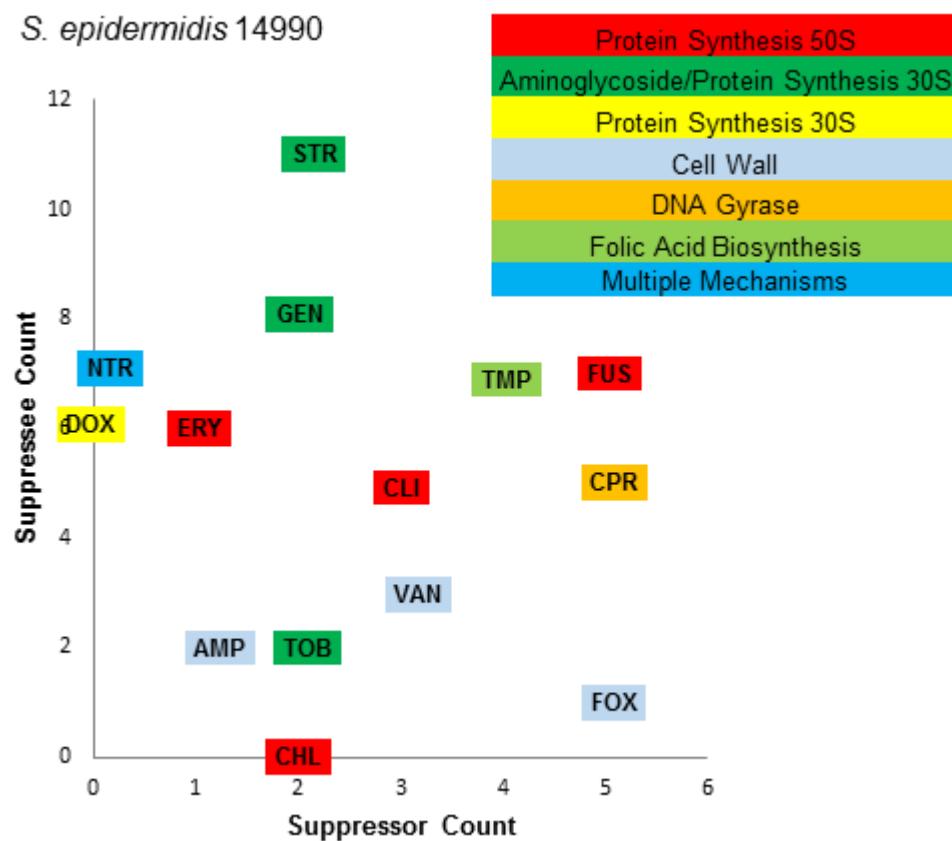

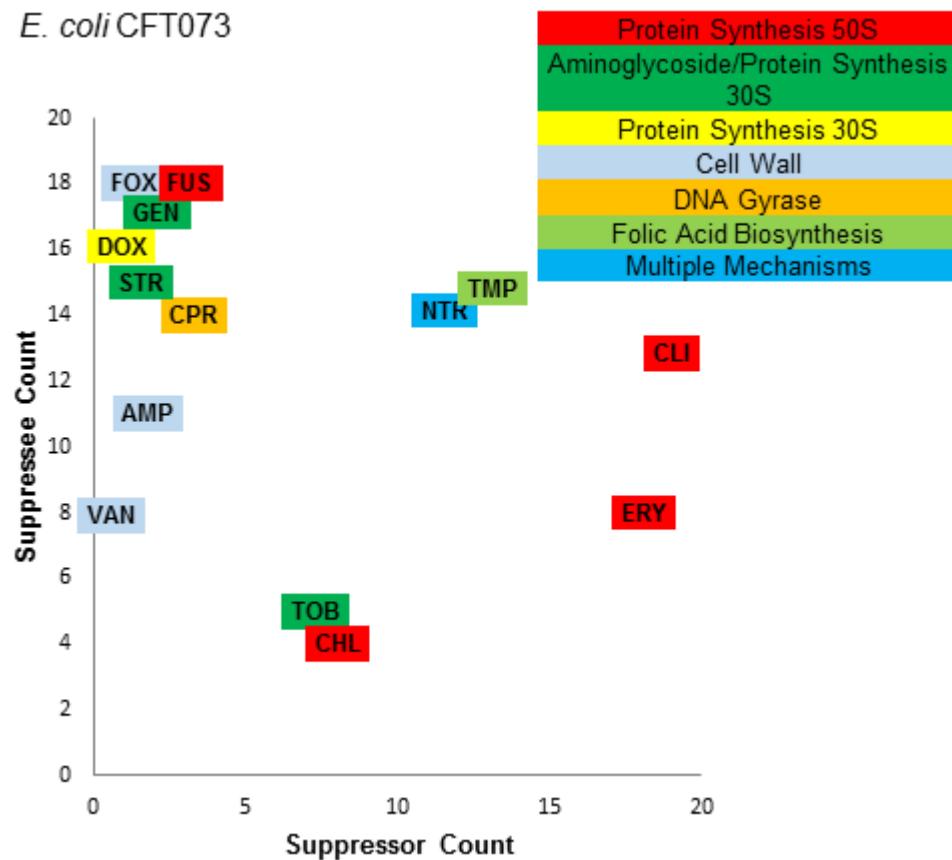

Supplementary Figure 5. Suppressor and suppressee antibiotics for *S. epidermidis* 14990 and *E. coli* CFT07. For each antibiotic, the number of suppressive interactions in *S. epidermidis* 14990 (above, $R=-0.115$, $N=14$, one-tailed $p\text{-value}=0.347$) and *E. coli* CFT07 (below, $R=-0.275$, $N=14$, one-tailed $p\text{-value}=0.171$) in which it acts as the suppressor (x axis) and the suppressee (y axis) are plotted. Antibiotic abbreviations are as listed in Table 1.

E. coli CFT073

Supplementary Table 1. Full data set for 14 drugs in *E. coli* BW25113, *S. epidermidis* 14990, and *E. coli* CFT073. Growth percentages (median, maximum, and minimum) as compared to the no-drug control (100% growth) are given for the three single-drug, the three two-drug, and the triple combination. For *E. coli* BW25113 concentrations are listed in $\mu\text{g/mL}$ and for *S. epidermidis* 14990 and *E. coli* CFT073 concentrations are listed in μM . For *E. coli* BW25113, n represents the number of independent experiments, each with 4-6 samples per experiment. For *E. coli* CFT073 and *S. epidermidis* 14990, all combinations were tested in exactly 2 independent experiments, and n represents the number of total samples over 2 experiments. Abbreviations are as listed in Table 1.
