

Supplemental Figures for:
Prolonged Temozolomide Maintenance Therapy in Newly Diagnosed Glioblastoma
Marco Skardelly et al.

Figure S1: Risk profile and time lines

This figure provides information on all relevant key parameters of each patient. The first column demonstrates the prognostic relevant covariates: extent of resection (EOR), *MGMT* methylation, age-50 and *IDH* mutation. The second column provides information about 2nd line treatments and the third column shows the complete time lines of all applied therapies. Color coding is defined in the figure legend. Abbreviations: RCT = radiochemotherapy, RT = radiotherapy, TMZ = temozolomide, PCV = procarbazine, CCNU (lomustin) and vincristin, Lom = lomustin, Bev = bevacizumab.

Supplemental Figures for:
Prolonged Temozolomide Maintenance Therapy in Newly Diagnosed Glioblastoma
Marco Skardelly et al.

Figure S2: Adjusted survival curve analyses of OS and PFS

Adjusted Kaplan Meier plots that demonstrate overall survival and progression-free survival of patients who received exactly 6 cycles of TMZ (group B, dashed line) and patients who received >6 cycles of TMZ (group C, full line).
