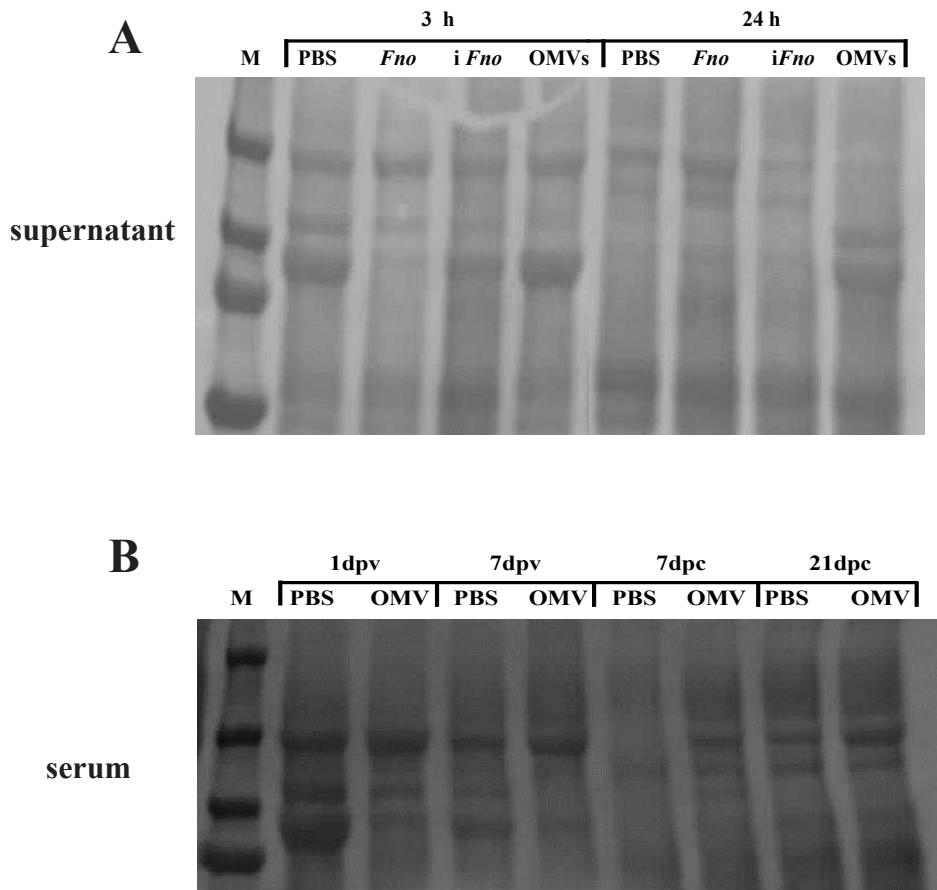

**Figure 1S.** Gating strategy of the major cell linages from kidney by light-scatter characteristics. **A.** The different gates shown the different cell subset using forward scatter (FSC) and side scatter (SSC). A: mature erythrocytes, B: lymphocytes, C: precursors, D: mielomonocyt cells. **B.** Discrimination of aggregates from singlets using SSC-W versus SSC. **C.** Cell viability using propidium iodine. **D.** Cells able to incorporate Fno-FITC. Representative experiemnt of three idenpendent experiments.

**Figure 2S**

**Figure 2S.** Incorporation of *Fno*-mCherry *in vivo* analyzed by flow cytometry. Transgenic adult zebrafish *mpx-gfp* were challenged with *Fno*-mCherry and the incorporation of *Fno* was analyzed at different time points. Spleen (A) and kidney (B) were isolated at 24 h or 48 h (C) after injection and analyzed by flow cytometry. Dot-plot show the percentage of neutrophil (*mpx-gfp*) (left column) and the percentage of cells able to incorporate *Fno*-mCherry (right column). The data are based on representative experiment of three replicates.

**Figure 3S.**

**Figure 3S.** Representative Western blot membrane showing protein content. **A.** Ponceau staining of supernatant protein after transfer to a membrane. Primary Zebrafish kidney cells cultivated *in vitro* for 3 h and 24 h in presence of PBS, *Fno* ( $1 \times 10^8$  CFU/ml), *Fno* inactivated in formalin (iFno) ( $1 \times 10^8$  CFU/ml) or MVs (20 µg). **B.** Ponceau staining of serum protein of zebrafish injected with PBS or 20 µg MVs at 1 or 7 day post vaccination (dpv); 7 or 21 days post challenge (dpc) with *Fno* ( $1 \times 10^6$  CFU) after transfer to a membrane. M: marker in kilo Daltons (kDa). The same amount of protein was load in each lane as measured by nanodrop, but different protein bands were observed between the different treatment and time point.
