

Supplementary Figure 2: Comparison of antibody secreting cell (ASC) responses to GI.1 and GII.4 (consensus) VLPs at day 7 post vaccine dose 1. Peak IgA ASC (a) and IgG ASC (b) responses to intramuscular immunization with the GI.1 and GII.4 VLP formulation were seen at day 7 post first dose of vaccine. Overall, the magnitude of responses to GI.1 VLPs was higher than to GII.4 VLPs ($p < 0.001$). Each bars represents the geometric mean of results for that group (error bars, 95% confidence intervals)
