Supporting information

S1 Table: Genome scan for milk production traits in a daughter design of 1,961 dairy goats, based on association analyses (***: 5% genome-wide significance).

S1 Fig: Manhattan plot of likelihood ratio test profiles for five milk production traits: milk yield (MY), fat yield (FY), protein yield (PY), fat content (FC) and protein content (PC) in the joint Alpine and Saanen population. The solid horizontal lines represent the 5% genome-wide thresholds (average over the 29 autosomes).

S2 Table: Whole results from the linkage and association analyses for five milk production traits: milk yield (MY), fat yield (FY), protein yield (PY), fat content (FC) and protein content (PC) in the three populations, i.e. Saanene, Alpine and joint Alpine and Saanen populations. The Likelihood ratio tests (LRT) are given for each position tested over the 29 autosomes.

S2 Fig: Conservation of the DGAT1 protein sequence between cattle, sheep and goat species, using the weblogo software (<http://weblogo.threeplusone.com/>). Amino acids are colored according to their chemical properties: hydrophilic amino acids (RKDENQ) in blue, neutral amino acids (SGHTAP) in green and hydrophobic amino acids (YVMCLFIW) in black. The statistical model for letter height and error bars is detailed in the weblogo manual (<http://weblogo.threeplusone.com/manual.html>).

S3 Fig: Frequency of the T allele for the R396W in the artificial insemination males depending on their year of birth.

S3 Table: Percent identity matrix of the DGAT1 protein sequence between different species of ruminants.

S4 Table: List of primers used in the study. Each primer is defined by a name, its sequence, its strand, its location on LT221856 (bp), its location on chromosome 14 of the reference genome, and indications of the protocol used and the parts of the gene concerned are given.
