

Supplemental figure 1. Spectra of the light sources used for plant growth.

Supplemental figure 2. Lengths of upper rosette branches (n and n-1) of plants grown under low R:FR, then provided with high R:FR or maintained under low R:FR, with and without decapitation at 120 h after initiating treatments. Data are means \pm SE with n = 13. Bars with different letters are significantly different at $\alpha = 0.05$.
