Pharmacokinetic analysis

Methods

- DSM265 and DSM450 concentrations in both dried blood samples (DBS) and plasma for 4 patients were obtained from Swiss BioQuant.
- Using Phoenix WinNonlin (version 6.3), a noncompartmental analysis was performed. The variables t_{\max} and C_{\max} were directly read from the plasma concentration-time curve whereas AUC was calculated using the linear trapezoidal rule. The $t_{1/2}$ could not be estimated reliably for the metabolite DSM450.
- Tables were generated with WinNonlin whereas the mean plasma concentration-time and the 'spaghetti' curves were generated with GraphPad.

Results: Cohort 1A.

Table S1 Mean DSM265 DBS concentrations (ng/mL) and descriptive statistics following administration of a single dose of 400 mg DSM265.

| Time (h) | N | Mean | SD | Min | Median | Max | CV% |
