

Supplementary figure 2. RPA is recruited normally to the sites of damage in NBS and ATR-Seckel LBL.

The indicated LBLs were either untreated or treated with 2 mM HU for 2 h and processed with mild permeabilised and extraction (0.1% Triton X-100, 30 sec) and IF using -RPA. Only untreated control cells are shown. All other untreated cells gave a similar lack of signal. RPA is recruited normally in all cells lines examined.
