Figure S1: B-cell development

(A) Representative dot plot of IgM^a and IgM^b expression in *wt* and *c3'RR* mice (*top*). Bar graph representing the percentage of IgM^a and IgM^b positive cells [gated on B220 positive cells] in *wt^a/wt^b* and *c3'RR^a/wt^b* mice (*bottom left*). Mean \pm SEM of membrane IgM^a and IgM^b densities in *wt^a/wt^b* and *μ 3'RR^a/wt^b* mice (*bottom right*). (B) Flow cytometry analysis of transitional (AA4.1⁺), follicular (CD21^{low}CD23^{high}) and marginal zone (CD21^{high}CD23^{low}) B-cells in *wt^a/wt^b* and *c3'RR^a/wt^b* mice. These experiments were performed on splenic cells from 2 month old mice.

Figure S2: CSR analysis

(A) IgG3 positive B-cells after 4-days LPS *in vitro* stimulation of splenocytes from *wt*, *c3'RR* and Δ 3'RR mice, analysed by flow cytometry (*left*). Right panel shows one representative experiment. (B) As in (A) for LPS + IL4 *in vitro* stimulation. Mean \pm SEM of 2 independent experiments, with 3 mice each.

Figure S3: Post Switch transcripts

Day1 to 5 kinetics of post-switch transcripts, in LPS +/- cytokines *in vitro* stimulated splenocytes from Δ 3'RR, *c3'RR* and *wt* mice. Mean \pm SEM of an experiment with 2 mice.

Figure S4: Positions and patterns of SHM

Positions and patterns of mutations in the introns flanking rearranged J_H4 and J _{κ} 5 segments, in *wt* compared to *c3'RR* and Δ 3'RR Peyer's patch GC B-cells. Mutation rate, total number of mutations identified, and total number of aligned bases are indicated. Data are shown for one representative mouse of each genotype.
