

Identification of DBCCR1 as A Suppressor in the Development of Lung Cancer that Is Associated with Increased DNA Methyltransferase 1

SUPPLEMENTARY FIGURE

Supplementary Figure 1: The difference between untreated A549 and control of knockdown/overexpression DBCCR1. A549 cells were transfected with shRNA vector or for 48 h as control of knockdown of DBCCR1. A549 cells were infected with Lenti-virus without DBCCR1 for 48 h as control of over-expression of DBCCR1. DBCCR1 expression was detected by PCR. The data showed no obviously difference of three cell lines.
