*Note:* A potential correlate was included in Tables 4A-4F if it was associated ( $p<0.10$ ) with the behavior in univariate analyses. *B*, SE and *p*-value estimates are from the multivariable model. Boldface indicates statistical significance ( $p<0.05$ ). Given the large number of potential correlates that were associated ( $p<0.10$ ) with the sun protection composite in univariate analyses, but were not significantly associated ( $p<0.05$ ) in the multivariable model, only variables that were significantly associated with the sun protection composite in the multivariable model are included in Appendix Table 1G. *B*, SE and *p*-value estimates are from the multivariable model
