Title of file for HTML: Peer Review File

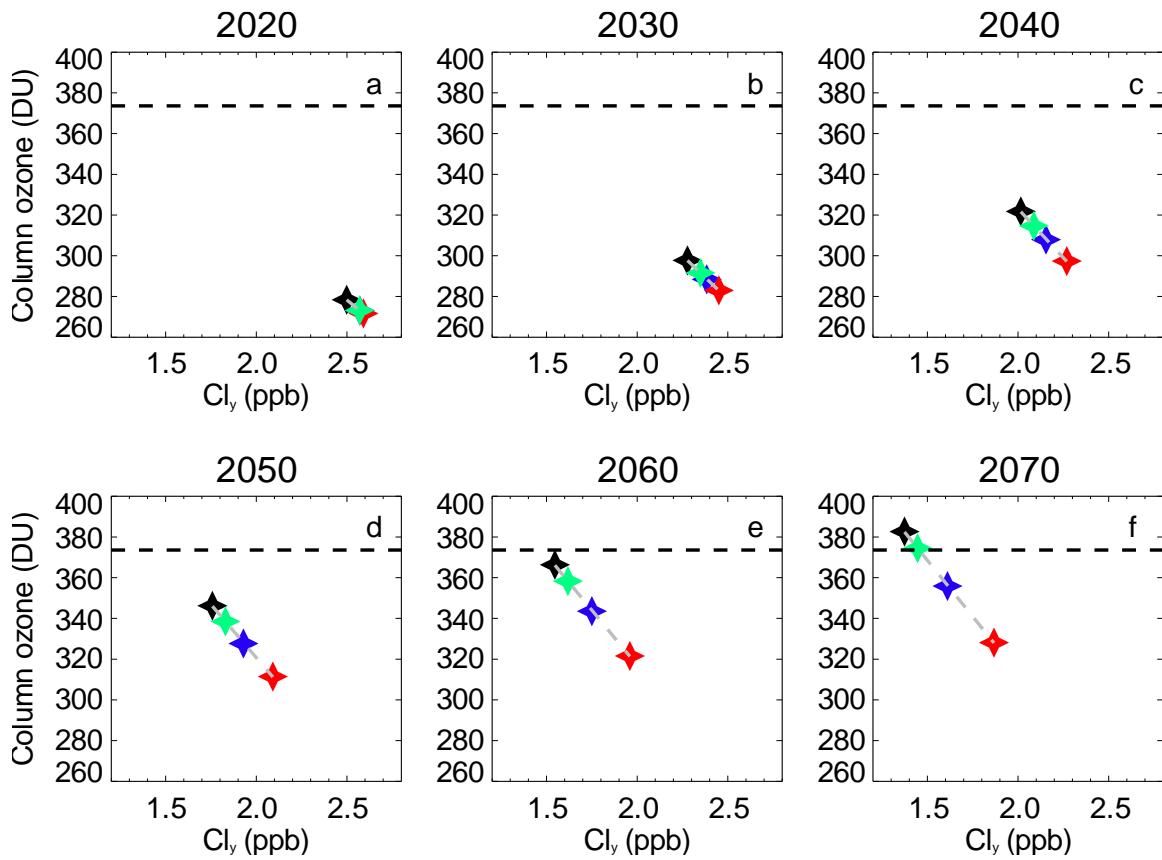

Description:

Supplementary Figure 1. Modelled inorganic chlorine (Cl_y) changes in the upper stratosphere. Cl_y changes are expressed in parts per billion (ppb) relative to 1980 baseline at 5 hPa for simulations without CH_2Cl_2 (black) and for CH_2Cl_2 growth Scenario 1 (blue) and Scenario 2 (red). **(a)** Cl_y changes in northern high latitudes (60°N - 90°N). **(b)** Cl_y change in northern mid-latitudes (35°N - 60°N). **(c)** Cl_y changes in southern high latitudes (60°S - 90°S). **(d)** Cl_y change in southern mid-latitudes (35°S - 60°S). Annotated are the projected dates when Cl_y returns to 1980 levels.

Supplementary Figure 2. Monthly stratospheric column ozone decreases due to CH₂Cl₂ in the recent past and present. **(a)** Difference in zonal mean monthly mean column ozone (Dobson units, DU) between run Scenario 1 and run no_{CH₂Cl₂}. **(b)** As **a** but expressed as percentage (%) change.

Supplementary Figure 3. Relationship between Antarctic stratospheric column ozone and inorganic chlorine (Cl_y). (a-f) Modelled October mean ozone column (Dobson units, DU) versus mean Cl_y (parts per billion, ppb) at 50 hPa (lower stratosphere) over Antarctica (60°S - 90°S). The relationship is shown for model simulations without CH_2Cl_2 (black star) and for CH_2Cl_2 growth Scenarios 1 (blue star) and 2 (red star). The grey dashed line is a linear fit to these data. The green star represents a constant offset to the no CH_2Cl_2 case, based on 2016 stratospheric loading of CH_2Cl_2 (i.e. the ozone- Cl_y relationship with no future growth in CH_2Cl_2). The baseline column ozone amount in 1980 is shown by the horizontal dashed line.

Supplementary Table 1. Annual mean mixing ratio (ppt) of CH₂Cl₂ entering the stratosphere under Scenario 1.

Year	CH ₂ Cl ₂										
2005	18.0	2021	44.6	2037	70.7	2053	96.8	2069	122.9	2085	149.0
