

Supplementary material

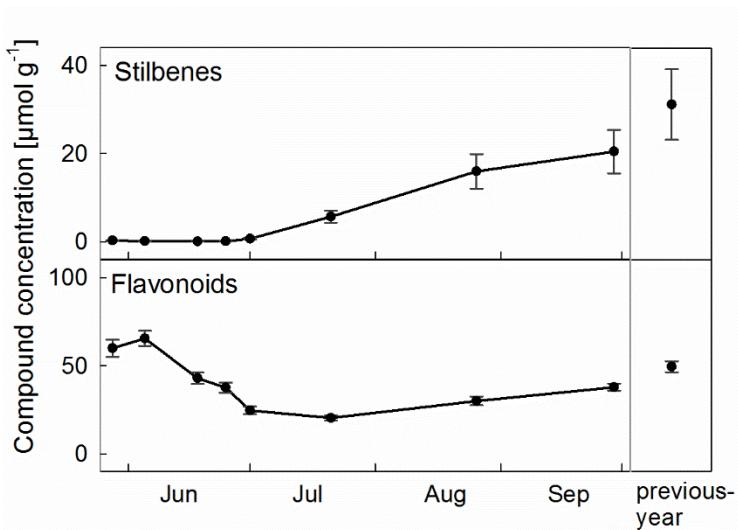

Foliar phenolic compounds in Norway spruce with varying susceptibility to *Chrysomyxa rhododendri*: analyses of seasonal and infection-induced accumulation patterns

Andrea Ganthaler, Wolfgang Stögg, Ilse Kranner, Stefan Mayr

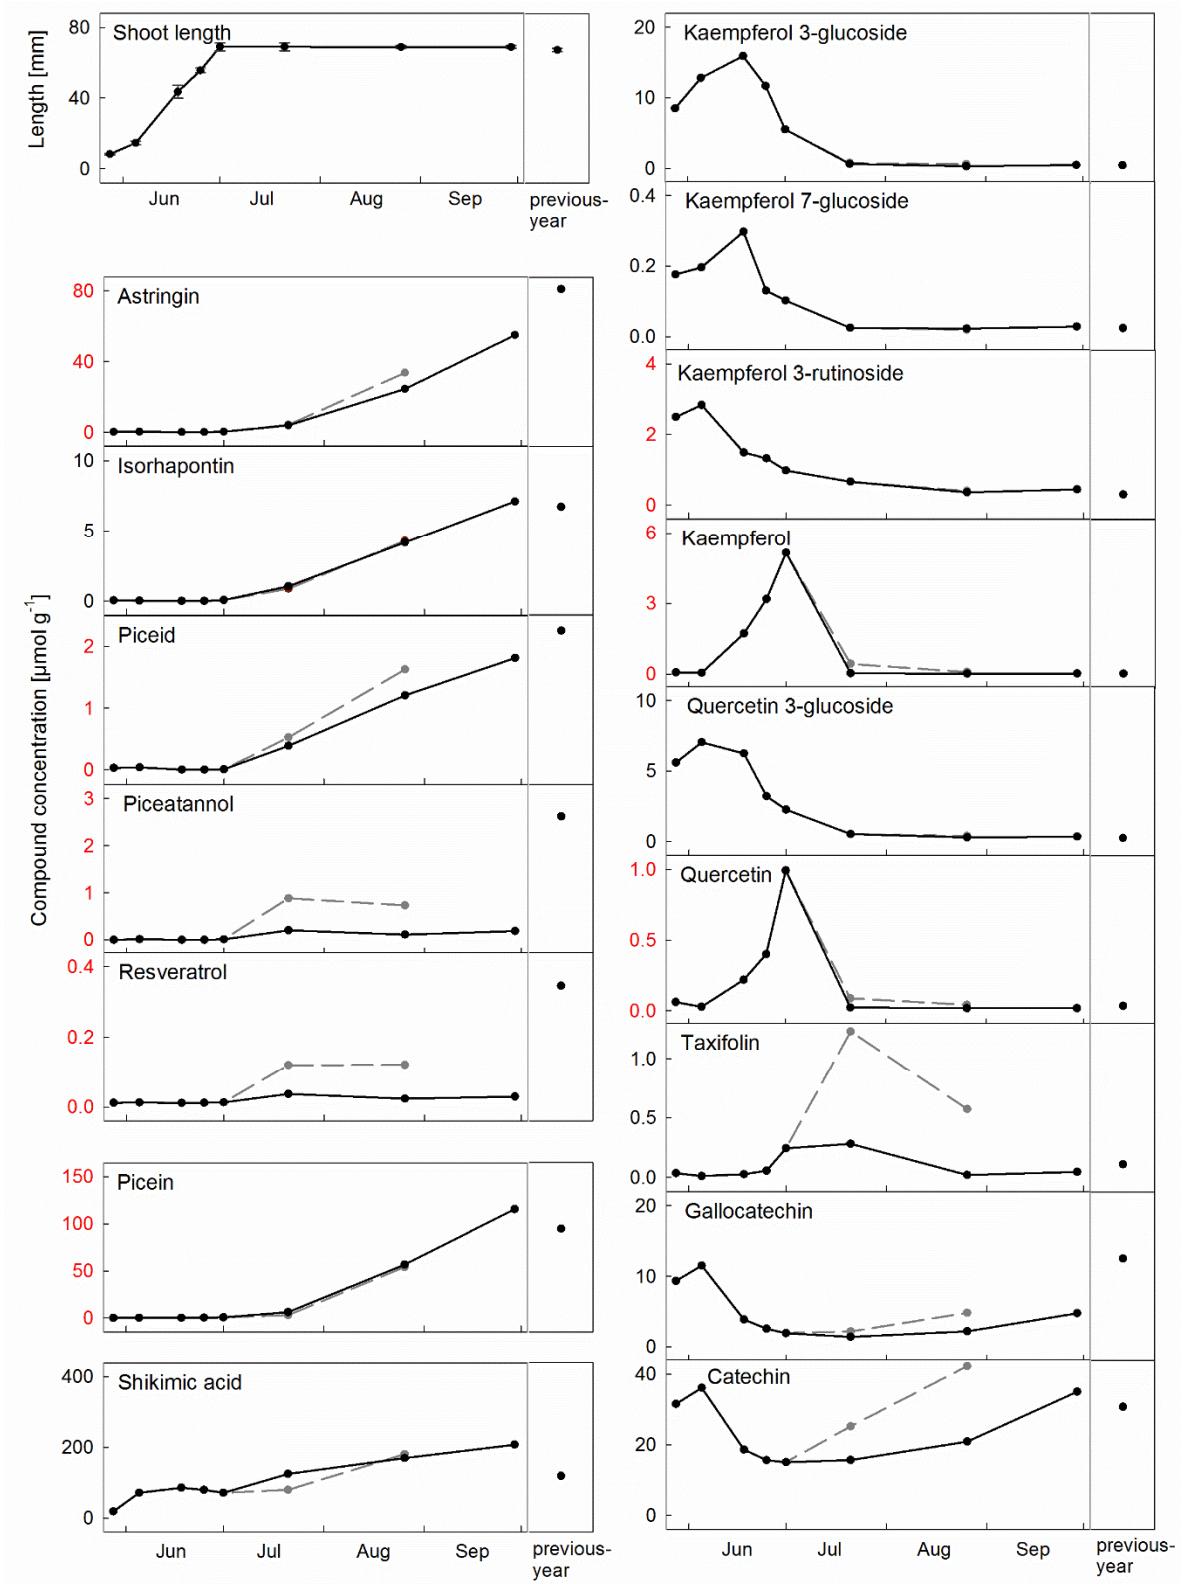

Supplementary Table S1. MRM transitions, settings and retention time (rt) for analyzed compounds and internal standards.

Q1 Mass (Da)	Q3 Mass (Da)	Time (msec)	ID	DP (volts)	CE (volts)	CXP (volts)	rt	Internal standard
405.0	243.0	10	astringin	-120	-26	-13	1.75	orientin

Supplementary Figure S1. Accumulation of total stilbenes and flavonoids during needle development in healthy needles (mean \pm SE, n = 9) from end of May to end of September and in previous-year needles. All values given as $\mu\text{mol g}^{-1}$ dry weights.

Supplementary Figure S2. Accumulation of phenolic needle compounds during needle development in healthy needles (black symbols) and infected needles (grey symbols) of the tree with low susceptibility PRA-R. All values are given as $\mu\text{mol g}^{-1}$ dry weight. Please note that the scaling of several y-axes (shown in red) does not conform to the scaling in Figure 2 due to distinct higher concentrations of several compounds in the tree PRA-R.
