

Supplementary Figure 1: Platelet EV increase migration of HUVEC but do not influence monocytic cell adhesion.

HUVEC were incubated with platelet EV, SEC-platelet EV, glioma-EV, or TNF α (10ng/mL, 4h). Syto13 fluorescently labelled THP-1 were perfused at 0.15 mL/min (3 dynes/cm²) and adherent cells were quantified in 6 different fields (A). HUVEC migration was assessed in a Boyden chamber in the presence of medium (ctrl), Glioma-EV, ECGF (200 μ g/mL), platelet EV, or SEC-platelet EV (B). P-values were calculated by ANOVA with Sidak's post-test (n=3).
