

S10 Fig. Fixation index (F_{ST}) of ddRAD-seq derived SNP markers between IVM-screened and drug-naïve F2 mapping populations of *Teladorsagia circumcincta* (n = 24 male worms for each population). The upper and lower whiskers represent maximum and minimum values outside the interquartile range (middle 50%) excluding outliers (i.e., values greater than Q3 or less than Q1 by more than 1.5 times the interquartile range).
