Supplementary Methods

CrossCheck is compatible with all contemporary internet browsers and does not require installation of any additional plug-ins or extensions. Overview visualization function was extensively tested in the latest versions of Chrome and Firefox browsers. There are no limitations incurred by CrossCheck to the size of uploaded dataset or reference database, all resources of hosting environment can be used on demand. However, for frequent processing of large datasets (over 20,000 gene symbols and 10MB reference database) it's advised to download and install CrossCheck on a local server.

Generation of the CrossCheck reference database

Database was manually compiled and organized in series of files in tab-separated values format to facilitate viewing and editing in spreadsheet applications as well as in plain text editors.

Generation of protein kinase consensus motifs for proteome-wide predictions

The PhosphoSitePlus substrate phosphorylation database was parsed and motifs were constructed for each kinase as follows. For each position in the motifs consisting of either 12 (low stringency) or 15 (high stringency) residues, consensus coefficient (q) was calculated for each motif position using frequency of appearance of each amino acid in that position ($freq$) normalized to total number of *different* amino acids appearing at that position. In other words, for each position (i) the following formula was used for each position in the motif, where n is the total length of the motif:

$$q_i = \frac{freq(i)}{\sum_{i=0}^n (unique\ amino\ acids)}$$

Amino acids were recorded into the motif only when $q > 1.2$

Supplementary Figure 1

STEP 1

(A) Select a CrossCheck reference database:

1 Genome-wide RNAi and CRISPR screens (PubMed) (51 screens, 31214 hits) [View Data](#)

OR

(A) Upload your own reference database file (TSV file):
[Browse...](#) No file selected.

STEP 2

(B) Paste your dataset (a column of gene symbols):

```
BRAF  
MTOR  
APC  
CYLD  
RIPK1  
IDH1
```

Supplementary Figure Legends

Supplementary Figure 1. CrossCheck user interface.

Supplementary Figure 2. Schematic of CrossCheck architecture and data flow.

Supplementary Figure 3. CrossCheck processing times. Indicated numbers of random unique gene symbols were used as input and were processed either online (www.proteinguru.com) (A, B, E and F) or on a local Apache server (C and D) using reference databases of indicated sizes. Times to finish the server-side process and produce the output files were recorded. Processing times as a function of increasing database size were given for a query of 5355 (E) or 100 (F) unique gene symbols. 10 iterations were done for online and 100 iterations were done for local server tests.

Supplementary Figure 4. CrossCheck Overview function analysis for the indicated genes, with sorting by the highest number of hits found in the CrossCheck reference databases *and* by the highest number of hits in a database for queried gene list at bicoloring threshold = 2.

Supplementary Figure 5. CrossCheck Overview function analysis for the indicated genes, with sorting by the highest number of hits found in the CrossCheck reference databases *and* by the highest number of hits in a database for queried gene list at bicoloring threshold = 10.

Supplementary Figure 6. CrossCheck Overview function analysis for the indicated genes, with sorting by the highest number of hits in a database for queried gene list at bicoloring threshold = 2.

Supplementary Figure 7. CrossCheck Overview function analysis for the indicated genes, with sorting by the highest number of hits in a database for queried gene list at bicoloring threshold = 10.

Supplementary Figure 8. CrossCheck Overview function analysis for the indicated genes, with sorting by the highest number of hits found in the CrossCheck reference databases at bicoloring threshold = 2.

Supplementary Figure 9. CrossCheck Overview function analysis for the indicated genes, with sorting by the highest number of hits found in the CrossCheck reference databases at bicoloring threshold = 10.

Supplementary Figure 10. Illustration of the high-throughput capability of CrossCheck. Cross-referencing of 2306 essential genes from Wang *et al.* discovers 9411 common hits in 49 out of 50 databases.

Supplementary Table 2. Kinase motifs used in the proteome-wide kinase predictions (PKSP) database. Motifs were generated using phosphopeptide information provided by the PhosphoSitePlus website (www.phosphosite.org). High, medium and low stringency motifs consist of 15, 11 and 9 residue positions with the middle (8th) residue as the phosphorylation site (yellow highlight), respectively.
