

Figure S10. KCH mice exhibit abnormal expression of nucleosome receptors. (A-B) Immunofluorescent staining of nuclei (blue), RAGE (green), TLR9 (red), TLR4 (green), or TLR2 (red) from KC and KCH mice at six weeks of age (n=5 mice/genotype, data are expressed as means \pm s.e.m). (C) Fold change of nucleosome receptor mRNA expression in KC and KCH mice by Q-PCR analysis (n=3 mice/genotype, data are expressed as means \pm s.e.m).
