

SUPPLEMENTARY DATA

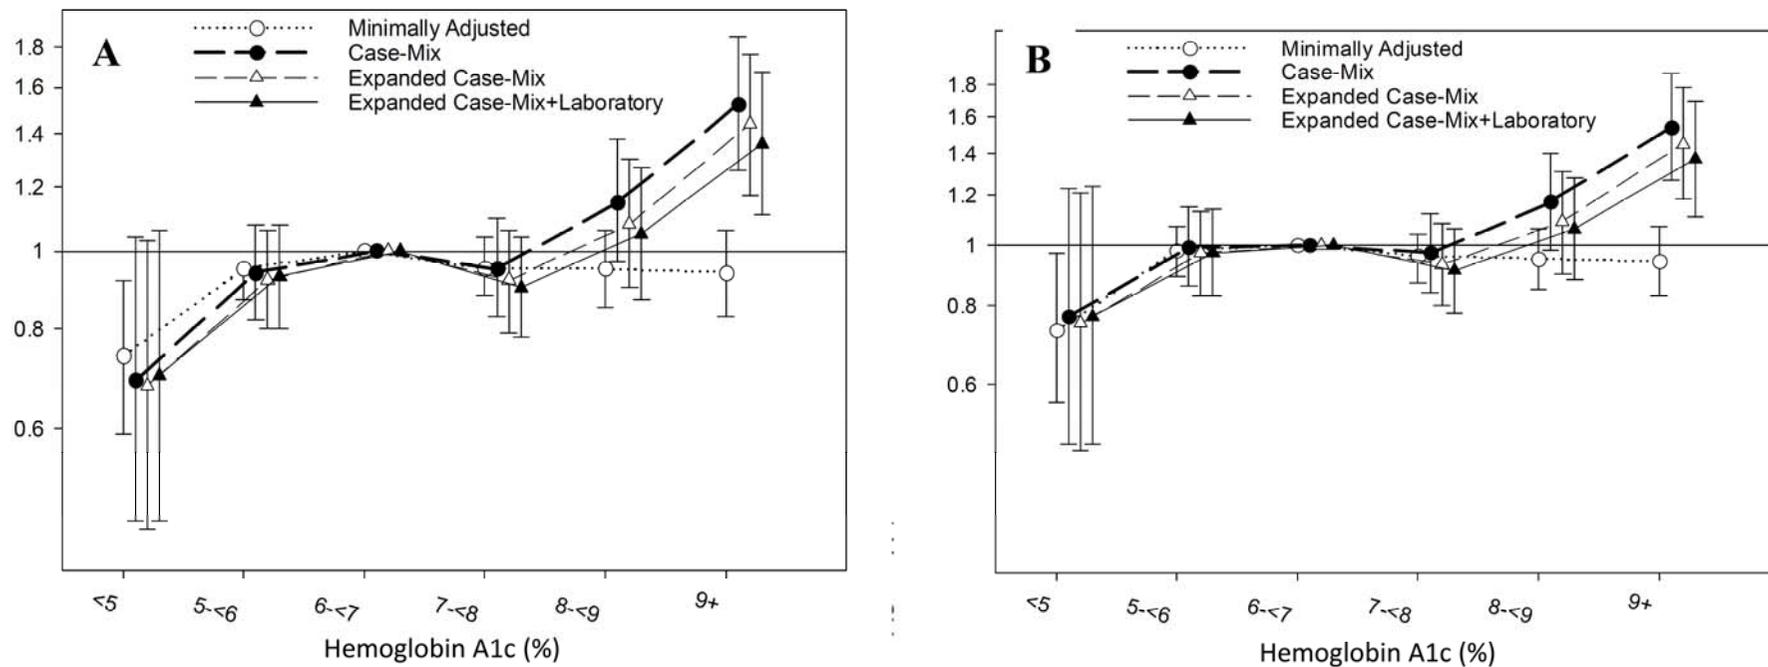

Supplementary Figure S1. Study cohort creation for hemoglobin A1c analyses.

*ICD-9 codes for diabetes: 249.xx, 250.xx, 357.2, 362.0x, 366.41.

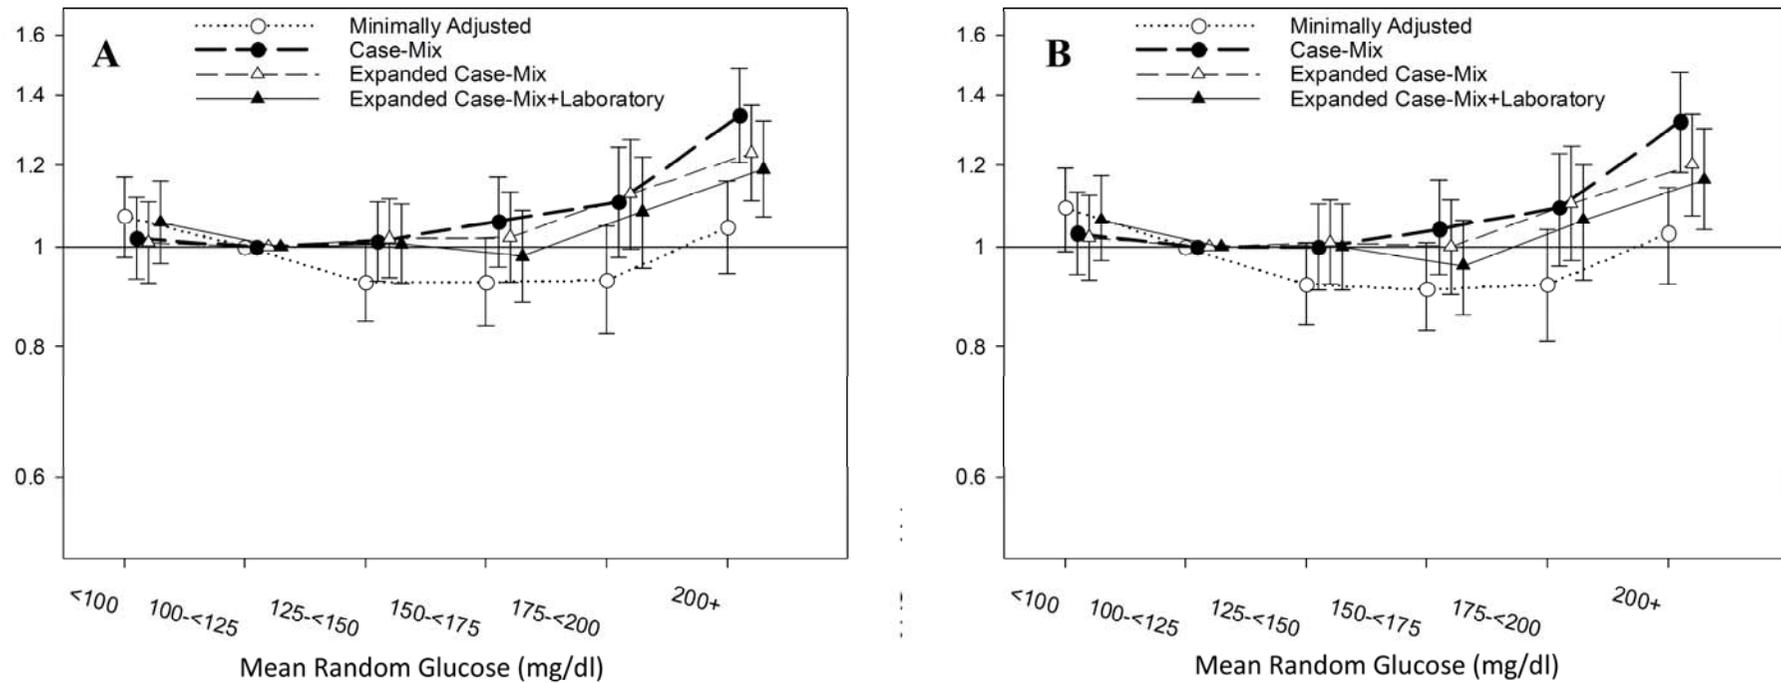

SUPPLEMENTARY DATA

Supplementary Figure S2. Association between hemoglobin A1c over the one-year prelude period and one-year cardiovascular mortality in the Overall Cohort (Panel A) and Restricted Cohort (Panel B) using Fine and Gray competing risks regression. Hemoglobin A1c levels of <5, 5-<6, 6-<7, 7-<8, 8-<9, and ≥9% equivalent to <31, 31-<42, 42-<53, 53-<64, 64-<75, and ≥75mmol/mol, respectively. Minimally adjusted model includes patient's calendar quarter of dialysis initiation. Case-mix model includes minimally adjusted covariates + age, sex, race, ethnicity, cause of end-stage renal disease, Charlson comorbidity index, diabetes, congestive heart failure, and cerebrovascular disease. Expanded case-mix model includes case-mix covariates as well as residential region, initial dialysis modality, and body mass index. Expanded case-mix+laboratory model includes expanded case-mix covariates + serum albumin, hemoglobin, serum bicarbonate, estimated glomerular filtration rate (eGFR) averaged over the one-year prelude period, and last eGFR level measured prior to dialysis initiation.

SUPPLEMENTARY DATA

Supplementary Figure S3. Association between mean random glucose over the one-year prelude period and one-year all-cause (Panel A) and cardiovascular mortality using Fine and Gray competing risks regression (Panel B). Minimally adjusted model includes patient's calendar quarter of dialysis initiation. Case-mix model includes minimally adjusted covariates + age, sex, race, ethnicity, cause of end-stage renal disease, Charlson comorbidity index, diabetes, congestive heart failure, and cerebrovascular disease. Expanded case-mix model includes case-mix covariates as well as residential region, initial dialysis modality, and body mass index. Expanded case-mix+laboratory model includes expanded case-mix covariates + serum albumin, hemoglobin, serum bicarbonate, estimated glomerular filtration rate (eGFR) averaged over the one-year prelude period, and last eGFR level measured prior to dialysis initiation.

SUPPLEMENTARY DATA

Supplementary Table 1. Association between hemoglobin A1c over the one-year prelude period and one-year all-cause mortality.

*Abbreviations: CHF, congestive heart failure; CVD, cerebrovascular disease; OADs, oral anti-diabetic drugs.

†OAD user indicates receipt of an OAD prescription anytime during the prelude period, whereas OAD non-user indicates no receipt of an OAD prescription during the prelude period.

Insulin user indicates receipt of an insulin prescription anytime during the prelude period, whereas insulin non-user indicates no receipt of an insulin prescription during the prelude period.
