For all tables: Predicted differences (95% CI) were estimated from linear mixed effects models adjusted for age, age squared, race/ethnicity, an interaction term between age and phthalate concentration categories, an interaction term between age squared and phthalate concentration categories, and an interaction term between race/ethnicity and age.

Table 1. Predicted differences in body mass index ( $\text{kg}/\text{m}^2$ ) from 7-13 years among girls comparing those with low, medium, and high concentrations of MBZP, MCPP, and MEHP<sup>a</sup>.
