**Supplementary Figure S1.** Functional assay measuring the inhibition of  $A_{2A}AR$  mediated cAMP production by compounds **5**, **19**, **22**, and **23** (A, B, C, and D, respectively). All the compounds close to completely inhibit the agonist effect of 1  $\mu$ M NECA (a reference  $A_{2A}AR$  agonist), as expected for competitive antagonism.

**Supplementary Figure S2.** Comparison of calculated (GLIDE-SP) and experimental relative binding free energies for 18 adenine-derived compound pairs. The solid line represents prefect agreement between calculated and experimental data whereas the dotted lines represent an absolute deviation of 1 kcal/mol.

**Supplementary Figure S3.** Evaluation of the relative binding free energy for two alternative binding poses for compound **3**. MD/FEP transformations from the intermediate compound (**24**) to each pose were performed. The atoms that are annihilated from compound **24** in each pose are shown in red.

**Supplementary Figure S4.** Potential energy curve for the indicated torsion of compound **21** calculated from using OPLS\_2005 and DFT.
