

Supporting Information for Susceptibility of colistin-resistant, Gram-negative bacteria to antimicrobial peptides and ceragenins

- Pages 2-3 Mass spectra (ESI, negative ion mode, Agilent 6230 Series TOF Spectrometer) of lipid A isolated from three clinical isolates of colistin-resistant *K. pneumoniae* (ARLG 1349, ARLG 1360 and ARLG 1389), from a colistin-susceptible strain (ATCC 13883) and from strains that were serially exposed to either colistin (Col-R) or CSA-131 (CSA-R).
- Pages 4-6 Proposed structures for lipid A isolated from the indicated strains that match the mass spectral data. Changes from the parent structures are in red. Location of acylation (addition of a fatty acid) and phosphate ester formation may not reflect exact structure (i.e., mass spectral data do not provide positional information for modifications).

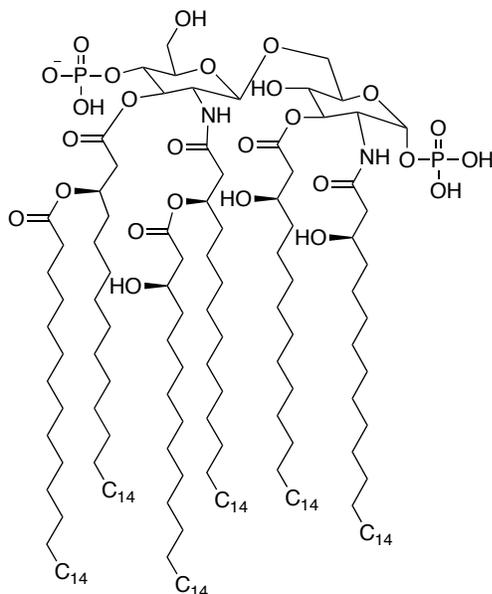

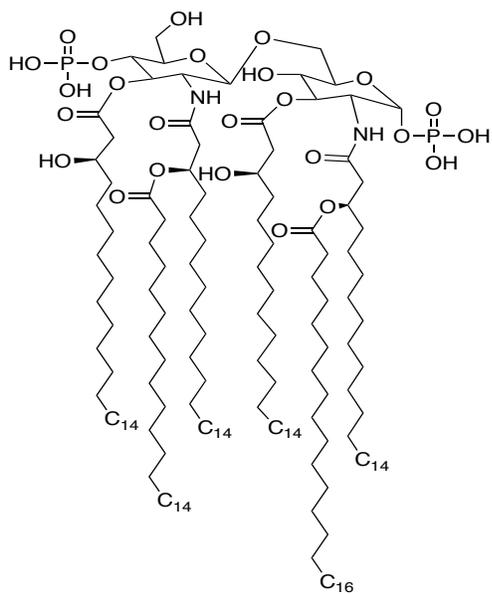

ATCC 13883

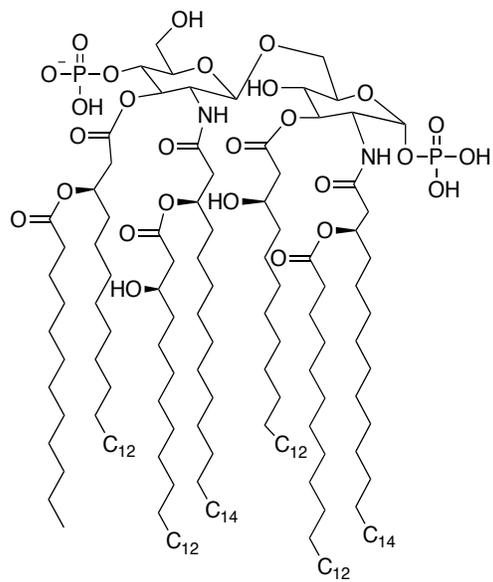

Exact Mass: 1795

Exact Mass: 1840

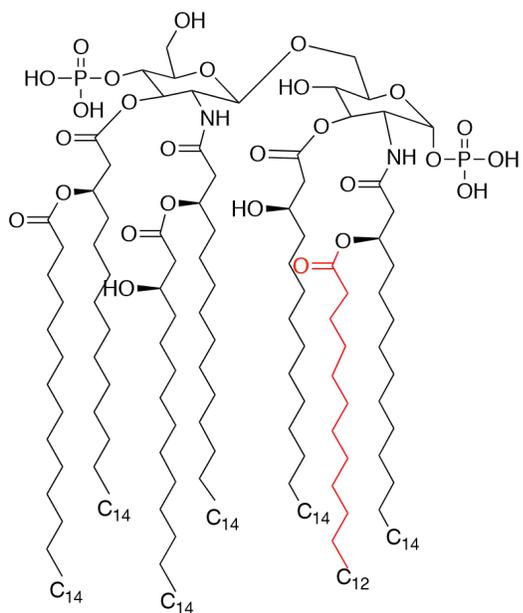

Exact Mass: 1853

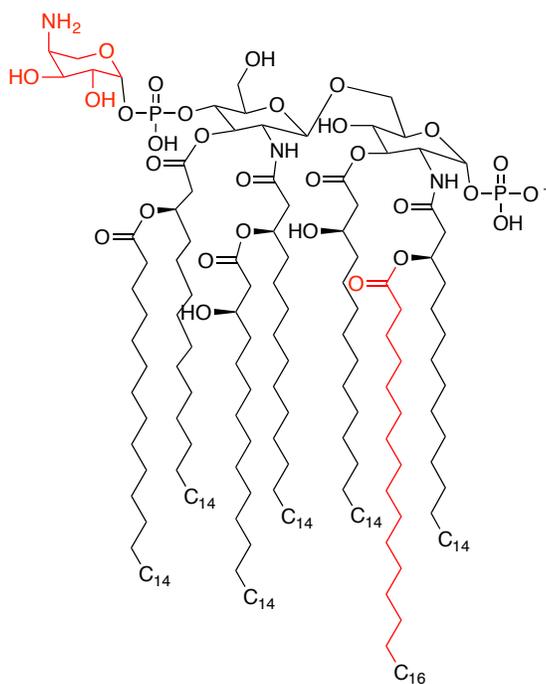

Exact Mass: 1910

ARLG 1349, ARLG 1389

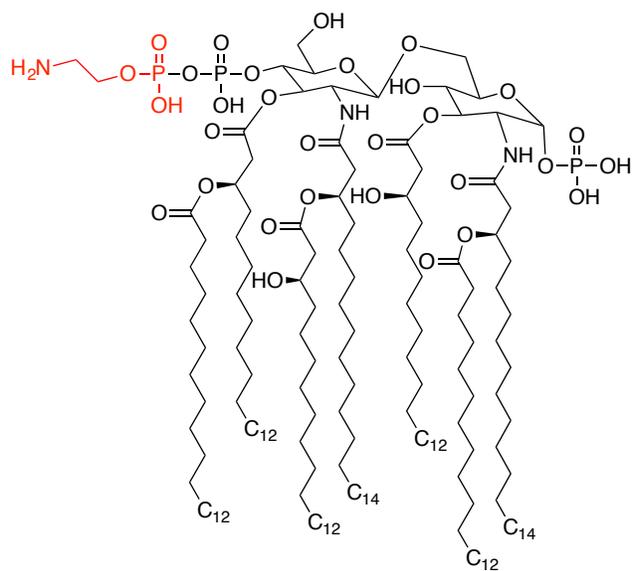

Exact Mass: 2023

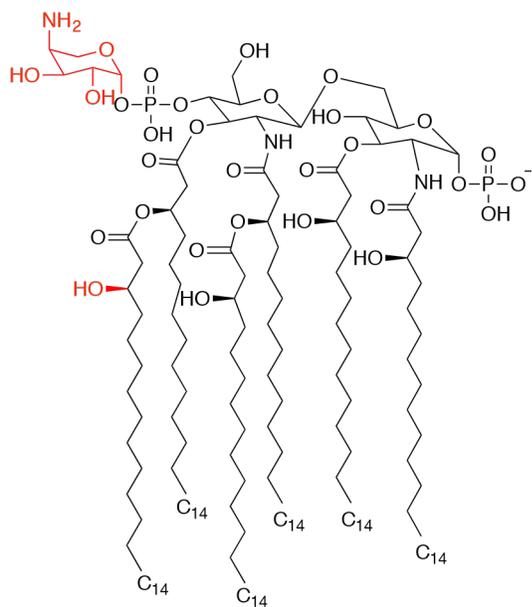

Exact Mass: 2209

ARLG 1360

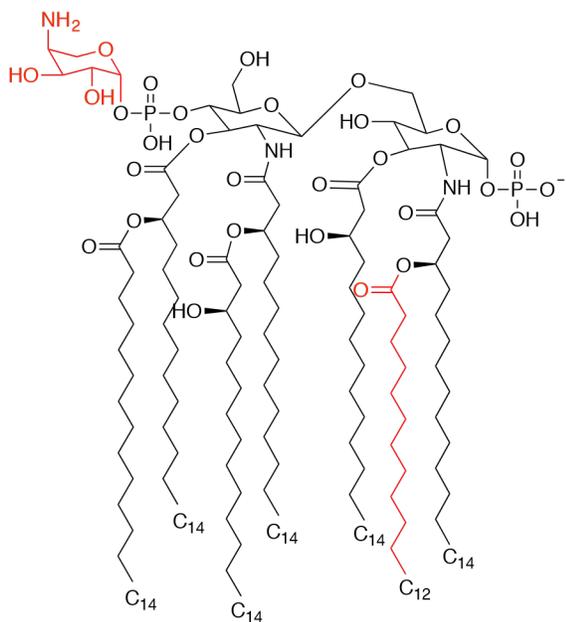

Exact Mass: 2034

Col-R (Colistin Resistant made by serial passaging)

Exact Mass: 1987

CSA-R (CSA resistant made by serial passaging)

Exact Mass: 2153
