Supplementary Figure S2:   Correlation analysis of OPG and other genes as continous variables

The correlation of gene expression values of OPG, estrogen receptor (ESR1), progesterone receptor (PGR), Ki67, and HER2 as continous factors was analyzed in the dataset of 2990 ER positive tumors. Hierarchical clustering was performed to visualize the relationship of all parameters. The two OPG probesets cluster in the same branch of the dendrogram as PGR.
