Sample codes

Shapefile database connection string

The correct connection string for connecting to the database of a shapefile depends on the OS and the dBase associated drivers installed on it. In the example here, the OS is a 64-bit Microsoft Windows with a 64-bit Access Database Engine installed on it. If Anylogic is running on a 32-bit Java virtual machine, the required database driver must exist in the 32-bit version of ODBC data sources, and vice-versa for the 64-bit versions. This driver could be either MS Access dBase drive or FoxPro driver. The following Java example code is using the MS Access driver.

```

try {
    Class.forName("sun.jdbc.odbc.JdbcOdbcDriver");
    String connString = "jdbc:odbc:Driver={Microsoft Access dBASE Driver (*.dbf, *.ndx, *.mdx)}";
    DefaultDir=D:\\";
    // D:\\ is the database location
    // Microsoft Access dBASE Driver (*.dbf, *.ndx, *.mdx) exists in Data Sources (ODBC)
    java.sql.Connection conn = java.sql.DriverManager.getConnection(connString);
    String sql="SELECT * from Grid"; // Grid.dbf is the file name
    java.sql.Statement stmt=conn.createStatement();
    java.sql.ResultSet resultSet=stmt.executeQuery(sql);
    while (resultSet!= null & resultSet.next())
        traceIn(resultSet.getString(1));

    traceIn("Done!");
}
catch (ClassNotFoundException e)
{
    e.printStackTrace();
}
catch (SQLException e) {
    e.printStackTrace();
}
}

```

Another connection string sample for C#.NET is as follows.

```

System.Data.OleDb.OleDbConnection connTest = new System.Data.OleDb.OleDbConnection();
connTest.ConnectionString = @"Provider=Microsoft.Jet.OLEDB.4.0;Data Source=D:\\;Extended Properties=dBASE
IV;User ID=Admin;Password=";
connTest.Open();
OleDbCommand com = new OleDbCommand("SELECT * FROM Grid",connTest);

```

Conversion of shapfile polygon features to Anylogic GIS regions

Polygon features in a shapefile are known as *PoliticalArea(s)* in Anylogic. The code below demonstrates how to extract the coordinates of all political areas in a shapefile, and store them in binary file using the libraries available in Anylogic 7.0.3. First a Java class called *GISPolygon* needs to be defined with the minimal functions. The coordinates of shapefile polygons are then stored in an instance of *GISPolygon*, and is saved as a binary file on the hard disk.

```

java.util.LinkedHashMap<Integer, GISPolygon> ShapefilePolygons = new java.util.LinkedHashMap<Integer,
GISPolygon>();
// Let's assume there's a GIS map component called map, and //
// the first shapefile on the map is the shapefile of our interest //
Object[] politicalAreasObjects = map.getLayers()[0].getPoliticalAreas().toArray();
PoliticalArea polArea;
GISPolygon gisPolygon;
int featureID=-1; // FID in shapefiles
for (int i=0;i<politicalAreasObjects.length;i++)
{
    polArea = (PoliticalArea) politicalAreasObjects[i];
    featureID = (int) Float.parseFloat(polArea.name); // The name column index of the shapefile on the map
    // is set to refer to the FID
    OMGeometryList gmList = polArea.getGeometry();
    OMGraphicList grList = (OMGraphicList) gmList;
    Object parent = grList.getOMGraphicAt(0);
    Object child = ((OMGraphicList) parent).getOMGraphicAt(0);
    // There may be a number of nested layers of features in the shapefile//
    while (child.getClass().equals(OMGraphicList.class)) {
        child = ((OMGraphicList) child).getOMGraphicAt(0);
    }
}

```

```

        parent = ((OMGraphicList) parent).getOMGraphicAt(0);
    }
    int polyCount = ((OMGraphicList) parent).size(); // The number of political areas under the same FID
    gisPolygon = new GISPolygon(featureID);
    for(int j=0;j<polyCount;j++) {
        OMPoly poly = (OMPoly) ((OMGraphicList) parent).getOMGraphicAt(j);
        double[] polyCoords = poly.getLatLonArray();
        ProjMath.arrayRadToDeg(polyCoords);
        gisPolygon.AddLatLonArray(polyCoords);
    }
    ShapefilePolygons.put(featureID, gisPolygon);
}
gisPolygon.SaveShapefilePolgons(ShapefilePolygons, "D:\\MyShapefile.dat"); // Store on hard disk as a binray file

```

The source code for the *GISPolygon* class is as follows.

```

public class GISPolygon implements Serializable {
    public ArrayList<double[]> latLonArrayList;
    public int npolygons=0;
    public int featureID;
    public GISPolygon() {
        this.featureID = -1; this.npolygons=0;
    }
    public GISPolygon(int featureID) {
        this.npolygons = 0; this.featureID = featureID;
    }
    public void AddLatLonArray(double[] latLonArray) {
        if (this.latLonArrayList == null)
            this.latLonArrayList = new ArrayList<double[]>();

        this.latLonArrayList.add(latLonArray);
        this.npolygons++;
    }
    public void SaveShapefilePolgons(Object shapefilePolygons, String filePath) {
        try {
            FileOutputStream fout = new FileOutputStream(filePath);
            ObjectOutputStream oos = new ObjectOutputStream(fout);
            oos.writeObject(shapefilePolygons);
            oos.flush(); oos.close();
            System.out.println("File saved!");
        }
        catch(Exception ex) {
            traceIn(ex.toString());
        }
    }
    private static final long serialVersionUID = 1L;
}

```

Some functions and libraries used above, such as casting from *OMGeometryList* to *OMGraphicList*, may not be available in all Anylogic versions. However, the coordinate extraction procedure is still similar, and could be adopted by developers.

Finally, the code below shows how to restore saved coordinates, and display them as Anylogic *GISregion(s)* on a map. It is notable that the *GISregion* component is not available in Anylogic 7.0.3, as such the code below was tested in Anylogic 7.2.0 PLE.

```

LinkedHashMap <Integer ,GISPolygon> loadedPolygon = new java.util.LinkedHashMap<Integer, GISPolygon>();
LinkedHashMap <Integer ,GISMultiRegion> MultiGISRegionsList = new LinkedHashMap<Integer, GISMultiRegion>();
try {
    ObjectInputStream in = new ObjectInputStream(new FileInputStream("D:\\MyShapefile.dat"));
    loadedPolygon = (LinkedHashMap<Integer, GISPolygon>) in.readObject();
    in.close();
}
catch(Exception ex) {
    traceIn(ex.toString());
}
GISRegion gisRegion;
GISMultiRegion gisMulti;
for (Integer entryKey : loadedPolygon.keySet()){
    GISPolygon poly = loadedPolygon.get(entryKey);

```

```
gisMulti = new GISMultiRegion(entryKey.toString());
for (int i=0; i<poly.latLonArrayList.size();i++) {
    gisRegion = new GISRegion(map, poly.latLonArrayList.get(i));
    gisMulti.add(gisRegion);
    map.add(gisRegion);
}
MultiGISRegionsList.put(entryKey, gisMulti);
}
```

^a. Home range values are the ceiling for the average radius of an estimated circular home range area in meters.

^b. Flight speed values are reported in meters per second. As it was not clear as to the type of speed that different papers reported, it is not recommended to compare the birds' speed by these values.

^c. Flocking under the Roosting column means that the species roost individually or in pairs during the breeding season, and then form flocks for migration in the fall.

^d. It is notable that for the Mourning Warbler, Veery, and Nashville Warbler, the sources of data were not clear as to the type of roosting that they did. The entries given represent a best guess, but further data would be needed for greater precision. Specifically, for the Veery, no mention of communal roosting was found in literature, but no mention of any other type was found. The Blue Jay and Gray Jay were difficult to properly categorize due to ambiguity in literature regarding their roosting behaviour.

^e. For the flight speeds of Eastern Phoebe and Say's Phoebe species, the average speed of the Tyrannidae birds in the dataset is used.
