Type 2 Diabetes, Glucose, Insulin, BMI and Ischemic Stroke Subtypes: Mendelian Randomization Study

Contents

Table e-1. Single nucleotide polymorphism used as instrumental variables in the Mendelian randomization analyses of type 2 diabetes, fasting glucose, fasting insulin, and body mass index	2-7
Table e-2. Mendelian randomization estimates of the associations between each genetically predicted risk factor and ischemic stroke and its subtypes in analyses using the inverse-variance weighted, weighted median, and MR-Egger regression methods.....	8
Table e-3. Mendelian randomization estimates (inverse-variance weighted method) of the associations between each genetically predicted risk factor and ischemic stroke and its subtypes in sensitivity analyses excluding pleiotropic loci	9

BMI, body mass index; EA, effect allele; SA, sensitivity analysis; SNP, single nucleotide polymorphism; T2D, type 2 diabetes.

*Excluded in a sensitivity analysis in which loci that overlapped between the four metabolic traits were removed.

†Excluded in a sensitivity analysis in which SNPs associated with blood lipids (low-density lipoprotein cholesterol, high-density lipoprotein cholesterol, total cholesterol, or triglycerides) at genome-wide significance were removed.

‡Adjusted for body mass index.

§The *BDNF* locus has been identified to be associated with smoking (PMID: 20418890). The SNP in this locus was excluded in a sensitivity analysis.

*The scaling of the odds ratios was one unit higher log-odds for type 2 diabetes and one standard deviation increase of fasting glucose, fasting insulin, and body mass index.

†A weighted median approach that downweights the contribution to the analysis of genetic variants with heterogeneous ratio estimates.

‡Confidence intervals were estimated using bootstrapping.

§MR-Egger regression estimates could not be identified because the SNPs had similar magnitudes of association with fasting insulin.

CI, confidence interval; OR, odds ratio.

*The scaling of the odds ratios was one-unit higher log-odds for type 2 diabetes and one standard deviation increase of fasting glucose, fasting insulin, and body mass index.

†Excluding the *TCF7L2* locus, which is strongly associated with type 2 diabetes and also weakly with glucose, insulin, and body mass index.

‡Excluding single nucleotide polymorphisms associated with low-density lipoprotein cholesterol, high-density lipoprotein cholesterol, total cholesterol, or triglycerides at genome-wide significance level in previous genome-wide association studies (PMID: 24097068, 20686565).

§Excluding the *BDNF* locus, which has been identified to be associated with smoking (PMID: 20418890) and also with body mass index.
