Supplementary Table 1: Deviance, Akaike Information Criteria, and Bayesian Information Criteria values for competing models.

	Deviance	AIC (df)	BIC (df)
Models for Girls (values displayed minus 120,000)			
BCT	302.3	335.6 (16.7)	474.0 (16.7)
BCPE	196.8	267.6 (35.4)	561.5 (35.4)
BCCG	300.7	334.4 (16.8)	473.9 (16.8)
Models for Boys (values displayed minus 114,000)			
BCT	127.6	173.0 (22.7)	361.3 (22.7)
BCPE	112.5	175.6 (31.6)	437.2 (31.6)
BCCG	221.4	265.3 (21.9)	447.2 (21.9)

BCT (Box-Cox t distribution); BCPE (Box-Cox Power Exponential); BCCG (Box-Cox-Cole-Green)

BCT and BCPE transformations model both skewness and kurtosis, while BCCG accounts for skewness only. They typically differ in how outliers are represented. BCCG allows the parameters: L (transformation), M (median) and S (skew) to be interpretable as characteristics of the original data, and thereby used in typical anthropometric software, such as WHO Anthro. This output has also been achieved by using BCT and BPPE with fixed value for kurtosis to eliminate it (effectively the BCCG method), or by generating LMS values derived from the final smoothed curves irrespective of methods used to model the original data.

Simplified cut off values are assigned according to age in completed years in a linear slope from 12.5cm at <5 years to 21cm at 19 years, which are commonly used fixed MUAC cut offs for young children and adults. The formula is:

$$cutoff = 12.5 + \left(\frac{17}{30} * (age \text{ in years} - 4) \right)$$
