

Supporting Information: Fig. S3

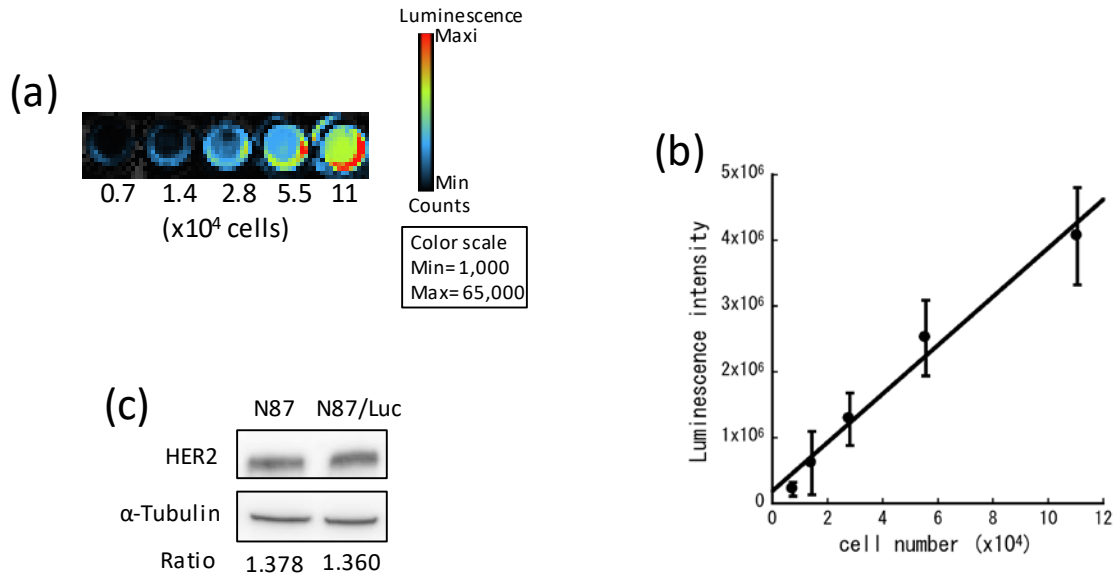

Fig. S3. Establishment of N87/Luc cells. (a) Representative luminescence images of various concentrations of N87/Luc cells (0.7–11 × 10⁴ cells) after 10-min incubation with luciferin (10 mg/mL, 50 μL/well). (b) Quantification of data in (a). The experiment was performed in quadruple. Mean ± SD. (c) HER2 expression in N87 and N87/Luc cells. α -tubulin as used as loading control. Ratios of the binding intensity of HER2 relative to α -tubulin are indicated below the images. N87 blots are identical to those in Figure 1a. N87 and N87/Luc blots were on the same membrane.
